that will grow and thrive and develop into profit producing specimens. When you buy from us you procure for yourself the selective breeding of generations. The parent stock of our chicks has been tested for prepotency and high egg capacity. Boyer's chicks have become known to thousands as the chick of no regrets. Send today for catalog telling how to feed and raise chicks.

Incubator Capacity 60,000 Eggs, Newtowns BOYER'S HATCHERY, Main St., Thorntown, Ind.

Take a young dentist. After he gets his license to practise he doesn't cease studying. He saves and plans, and with \$500 accumulated, he goes away to a dental clinic in a big city to see how the great doctors handle their cases.

Wages handicap the poultry judge from doing likewise. A judge at Chicago may get \$50 for his work. His railway fare and hotel bill absorb most of it. He cannot afford to spend \$200, take a week off, go to the New York show and compare notes. If he did make that investment, Chicago would still pay him \$50 for his work. What's the use?

Few good men are making a profession of poultry judging. The season is short, the work exacting, the pay poor. Those who are judging at New York, Boston and Chicago could make more money than their judging engagement nets them, by sitting down in their own homes some evening and writing a single article for these columns on any phase of judging, mating or growing Standardbred fowls. We wish that not less than a dozen of these judges would take the hint, and send in their articles.

So much for the weakness of our judging system. There is another angle.

As an exhibitor, do you ever encourage the judge? Little men are notorious fault-finders. Their emphasis is thrown on the weaknesses of their fellows. Thus their influence is in the wrong direction.

We may have different viewpoints. Men standing on a street corner will fix the speed of passing automobiles at figures as widely at variance as 18 to 35 miles an hour. All of them are honest, but some of them are mistaken. Don't say the other fellow is wrong unless you know for sure.

Big men are generous in their estimate of the virtues and talents of others. They encourage, stimulate and inspire by their very belief in a man's talents and usefulness. Are the exhibitors of this country making the judges stronger and better by their own courageous and generous mental attitude toward them?

* * *

Loss by Fire.

W. H. Besuden reports a fire which occurred at his brother's plant. The poultry house, valued at \$4,000, was completely destroyed, together with 300 head of Partridge Plymouth Rocks and Cochins Bantams. It is hard to place a value on these breeding flocks, and many friends and customers of C. S. Besuden, Ohio, will regret to learn of his severe loss and disappointment just at the dawn of another breeding season, when every poultryman's hopes are brightest with anticipation.

* * *

Receipts of Eggs.

Eggs were coming in pretty heavy in January, and prices declined as a result. Prices have since stiffened with receipts now running less than last year. For the three days of Feb. 13, 14 and 15, 1922, receipts at the four principal markets of Chicago, New York, Boston and Philadelphia, totaled 91,145 cases, against 165,617 cases for the corresponding days of 1921.

Receipts at these four principal markets since Jan. 1, 1922, to Feb. 16, 1922, were 1,185,644 cases; against 1,189,865 cases for the corresponding period of 1921, according to the statistical information collected by the U. S. Bureau of Markets. Receipts of dressed poultry from Jan. 1, to Feb. 16, 1922, are thirty-one millions pounds, the same as for the same period of 1921.

Young pens 1-3-4	1-2-3	Young pens 5	1-3

Best display in both single and Rose Combs at Boston and Madison Square Garden the same year—153 birds in my combined exhibit and 130 in the awards. These sensational winnings made not in small classes but among the greatest collection of show birds ever exhibited.

BREEDING BIRDS

Success with Rhode Island Reds lies chiefly in the ability of the breeding stock to reproduce. My breeding birds are reliable producers of show birds and heavy layers for they have over 50 years of systematic breeding in their blood lines and hundreds of prize winners in their ancestry. Satisfied customers everywhere vouch for their merit. Elegant single birds, trios and pens ready to be mated.

Grand Matings for Hatching Eggs

No other matings ever contained such wonderful specimens as mine this year. Not only do they contain my great winners at Boston and Madison Square Garden but the tested breeders that produced them. The same blood lines and as near as possible the same birds that produced these winners last year are mated again this year, making the most reliable breeding combination for the production of show birds and heavy laying stock ever offered to the buying public. Hatching eggs from these grand matings furnish a splendid opportunity to procure this blood at reasonable prices. Send for free mating list.

to keep the hens comfortable and is excluded so that it will not be disturbed by other fowls during the hatching period.

A very satisfactory type of equipment for hen hatching is the so-called combination hatching and brooding coop, illustrated in connection with this article. There are several models of these coops designed to accommodate anywhere from one to several hens. A very convenient form is the one advocated by Professor H. L. Kempster of the University of Missouri poultry department. This coop is built 30 inches wide by 60 inches long, and is designed to accommodate four hens during the hatching period and two hens during the brooding period to hover the chicks hatched by the four. This makes it a 60-egg incubator and a 60 chick brooder. It is a comparatively easy task to move a hen that is really in earnest about setting from the nest where she becomes broody to a properly constructed box where the owner wants her to set. After the hen has shown indications of broodiness for two or three days she usually can be moved at night to her new quarters and if given a few nest eggs will usually soon accustom herself to her new surroundings and set without protest.

The object in having the setting nest on the ground is to provide the proper moisture conditions. When hens are set high off the ground on dry nest material, particularly if the weather is dry, poor hatches frequently result due to the lack of moisture in the nest. Then again a nest made on the ground enables the hen to keep the eggs warm in cold weather, whereas a nest that allows free circulation of the air on all sides may cause chilling of the eggs from the bottom and thus injure the hatch.

Hens should be set in a closed nest where they will be protected from the annoyance of other birds and should be taken out of the nest once a day, fed and watered and have some attention to see that they return to the proper place.

Many poultry keepers have the idea that hen hatched chicks are stronger than those hatched in incubators, but this is not true where well built incubators are used that supply the proper conditions of ventilation and moisture control and are handled carefully, so that the temperature is neither too high nor too low. The strength of the incubator hatched chick is very largely dependent upon the temperature conditions during the incubation period and in many cases weak chicks under hens are due to the hen not keeping the temperature conditions correct in the nest. A hen that stays off the nest for long periods of time or one that does not closely hover the eggs often permits chilling of the eggs in the nest so that the chicks are weakened.

The better made incubators are constructed with due regard for provisions for proper ventilation and moisture control when operated in a room that has good ventilation. In some of the cheaper incubators the poor construction of the machine makes it so difficult to keep the proper temperature that ventilation is often neglected, with the result that the developing chicks are seriously weakened by the gases given off during the

Grand Champion Red female, St. Louis, 1921

incubation period not being removed through the ventilators. Even with well built machines many hatches are seriously weakened by the incubator being operated in a room without ventilation. This is particularly likely to occur where a cellar is not available for incubation and the incubator is run in a vacant room in the dwelling. Under such conditions the operator usually is afraid to open the window for fear the temperature will go down, and by keeping the room tightly closed fails to provide the supply of fresh air needed. A well ventilated cellar or basement room is the most desirable place for operating an incubator, but in case such a room is not available good results can be secured by operating the machine in a room above the ground where the temperature of the room can be regulated by heat from the stove and fresh air supplied by opening a window or a transom.

The temperature at which the eggs are kept during the hatching period is the most important factor in determining results of the hatch. A long series of experiments conducted by the Purdue Experiment Station show that a variation of more than two or three degrees from the optimum temperature if continued for any length of time will decidedly reduce the number and quality of chicks hatched. According to their results, the best hatches are secured when the temperature, as registered by a standing thermometer level with the top of the eggs, but not touching them, is held at from 101 to 102 degrees throughout the hatch. Their results show that a temperature below 100 degrees or above 103 if maintained throughout the hatch reduces the number of chicks hatched and increases the number of crippled and undesirable among those that do hatch.

Extreme variations in temperature if maintained only for a short time are also detrimental to best results. When the thermometer shows a temperature above 105, there is very serious danger of the entire hatch being spoiled, and higher temperatures are more disastrous than low temperatures where the variation is only for a short period.

Temperature regulation is best secured by running the machine without eggs for two or three days until the operator learns how to hold the heat in the egg chamber at within a half degree of the desired point. Then after the thermostat is adjusted to hold the temperature at the desired degree, it should not be changed throughout the hatch and the temperature should be regulated by raising or lowering the flame to increase or decrease the heat as needed.

Modern practices in incubation show that the eggs do not need to be cooled during the incubation period, but they must be turned at frequent intervals to prevent deformed chicks. Most authorities recommend that eggs be turned twice daily during the hatching period.

More strong chicks can be hatched by setting eggs that were laid by breeders specially selected for vigor and given free range during the hatching season; by providing a comfortable, sheltered nest for the setting hen; or if incubators are used, by setting only well made machines and by taking care to see that the incubators are operated in a room that is well ventilated and that the temperature is controlled inside the machine so that the thermometer registers 100-103.

HEAVY FLOCK AVERAGE

First Egg Type Pullet, December, 1920, at Coliseum, Chicago.

PROFIT

Is what you want from your flocks. An occasional high record individual does not always mean a profitable flock.

GREWE'S S. C. WHITE LEGHORNS

Have been bred and selected for years for CONSISTENT FLOCK PRODUCTION. Generations of pedigreed breeding and high record producers up to 286 eggs in one year are back of them. No guesswork. A customer reports average flock production of 232 eggs per hen from two-year old hens.

If it is LAYING LEGHORNS you want—If it is EGG PROFITS you want, get my Circular and full particulars before placing your 1922 orders for CHICKS or EGGS FOR HATCHING.

ROBADEL ORPINGTONS

The Undefeated Champions of the World

AT MADISON SQUARE GARDEN POULTRY SHOW, the World's Greatest Poultry Exhibition, held January 25th to 29th, inclusive, 1922, ROBADEL WHITE ORPINGTONS for the fourth consecutive year won best display.

The Story in Detail: Seventeen Individual Exhibitors

Exhibitor No. 1	RHOBAD	POULTRY	FARM	WON	55 points
Exhibitor No. 2	?	?	?	?	31 points
Exhibitor No. 3	?	?	?	?	25 points
Exhibitor No. 4	?	?	?	?	4 points
Exhibitor No. 5	?	?	?	?	3 points
Exhibitor No. 6	?	?	?	?	3 points
Exhibitor No. 7	?	?	?	?	2 points
Exhibitor No. 8	?	?	?	?	2 points
Exhibitor No. 9	?	?	?	?	2 points
Exhibitor No. 10	?	?	?	?	1 points

The remaining seven exhibitors did not score a point. ROBADEL WHITE ORPINGTONS won the third consecutive leg on the MADISON SQUARE GARDEN \$100.00 SILVER CUP offered two years ago for White Orpingtons, which had to be won three times to gain ownership.

ROBADEL 1st Young Pen of White Orpingtons won the CRAWFORD MEMORIAL SILVER TROPHY offered for the best young pen in the largest class of young pens, with at least five exhibitors competing. This is without doubt the most valuable trophy ever offered at a poultry exhibition.

ROBADEL BLACK ORPINGTONS won best display and all specials. Their win included 1st and 2nd Cock, 2nd and 4th Hen, 1st and 2nd Cockerel, 1st and 2nd Pullet, 1st and 2nd Old Pens and 1st and 2nd Young Pens in the strongest class of Black Orpingtons that has been seen at MADISON SQUARE GARDEN in several years. The competition included four CRYSTAL PALACE winners from ENGLAND, none of which got better than 3rd.

ROBADEL BUFF ORPINGTONS won 3rd Cock, 4th Young Pen and 5th Old Pen.

Our exhibition string of Orpingtons at MADISON SQUARE GARDEN numbered 136 specimens, 72 of which wore ribbons. If you are interested in the purchase of White, Black or Buff Orpingtons, come to headquarters. If you have tried Orpingtons and been disappointed, try again, but try right.

We do not sell hatching eggs or baby chicks, but can supply you with breeding stock or exhibition birds of the very highest quality. Every sale is positively guaranteed in a way that means something. Correspondence solicited.

What Is the Most Profitable Breed to Keep?

(Continued from page 312)

being equal—so much as the price received for it. If I pay \$8,000 a year rental for a little frontage on a main business street and have a chance to make a profit of \$10,000 per year, I am better off than if I had "economized" and had a larger store for \$2,000 on some side street, with one-fifth of the chances for my business profitable.

This is an important question, for a large percentage of all eggs produced in a year on the average commercial farm go either to the commission man or to the consumer direct. We know that New York does pay more for white-shelled eggs than for brown ones. The difference is gradually disappearing. According to the latest quotations as I write this article, I find but a few cents in favor of the white egg, and this in the biggest white egg market in the world. If the owner of a flock of brown-shelled layers is located advantageously, he may be able to dispose of his eggs at as high and sometimes a higher than white-shelled prices, so that need not worry him. We know that Boston favors the brown egg, and so it goes.

Sale of Chicks and Hatching Eggs.

Here we note that the heavier breeds show no disadvantage over the lighter. Prices for these products are almost invariably quoted higher for the former than the latter. In this we may see that the cost of production is pretty well equalized. If Leghorn chicks are quoted at 20 cents each, those of the dual-purpose breeds of the same quality sell for from 5 to 10 cents more each, a gain of between 25 and 50 per cent. This does not apply in the cases of highly specialized high record breeding establishments where premium prices are asked and received for these products. If we have a trapnested flock of 200 and 300-eggers we secure almost anything we ask for eggs and chicks—and deserve getting it.

Amount Received for Breeding Stock.

Unquestionably a well-bred Leghorn hen will command about the same price as a Plymouth Rock or Wyandotte of equal quality. The question of weight does not enter into the transaction here. The better grades of breeding farms secure a high price for choice specimens, and I cannot find that any one breed has the advantage over the other. Individual efforts, initiative, trapnested records, advertising—all determine the exact prices received.

Amount Received for Carcass.

Here, of course, the heavier breeds have the advantage; first, because of the extra weight, and, second, because of the extra price per pound—a double profit. A four-pound Leghorn hen selling for \$1.25 cannot hope to compete with a six-pound Rhode Island Red hen selling at \$2.40. Here again we find that the heavier hen pays for the additional investment necessary to produce, feed and house her, and so she strikes her balance again.

These conditions will and eventually must in a large measure determine the kind of breed best for you. If you start out with Leghorns you may find them less profitable for you than the Reds

NABOB HATCHERIES

Department 19

Gambier, Ohio

would have been, and vice versa. A careful study of the conditions which rule the market you can most advantageously serve will be the basis for a safe and san selection of the breed and variety you should keep for greatest profit.

Climatic Conditions.

And hand in hand with the foregoing paragraph we note that climate has quite a bit to do with the kind of fowls we may best breed. Leghorns certainly may do well in Canada, and Plymouth Rocks prosper in southern Florida, but we find it usually wisest to adapt our breed to the climate as closely as possible. The excessive cold of the northern lands takes its toll of vitality from the more lightly-feathered varieties, and the long, warm summer weather of the south will make the heavily feathered birds less comfortable and productive than those of the more scantily feathered kinds.

Demand.

Here we often have the kernel of our entire decision in regard to which breed to keep.

In order to gain the opinion of a disinterested man concerning this entire question, I wrote a poultryman who keeps an equal number of S. C. White Leghorns and Rhode Island Reds—about 1000 of each. I asked him about comparative costs and profits, and as to whether he found one more profitable than the other. He has this to say: "Breeding and boosting both of the breeds you mention, I can claim to be pretty fair in my answer. Frankly, I cannot see much difference. I sell every chick and hatching egg I can spare, dispose of surplus breeding stock for good prices, and sell my table eggs pretty advantageously. I must admit that I don't keep separate cost charts, but I feel convinced that my Reds eat more and I know they take about 25 to 30 per cent more housing room. I find, however, that I secure somewhat better chick and hatching egg prices for my Reds, and, of course, as a table proposition, they surely make up for extra feed consumed and housing required. I feel positive that either breed—or any good breed, for that matter—properly handled, will show a satisfactory return. Sorry not to have more definite figures, but gather from your letter that was about what you wanted."

Now that we have considered all of these factors, we might come to the conclusion that it would pay us about as well to keep one good variety as another. And yet we are faced with the fact that 95 per cent of all the commercial egg flocks of the West Coast are of the S. C. White Leghorn variety, while throughout the country certainly more than one-half of all the commercial egg farms keep the Leghorn either exclusively or as one of two or three breeds. What are the reason for this?

Mainly, I believe, because the Leghorn permits of more intensified cultivation than the heavier, and because from a purely table egg standpoint a dozen eggs may generally be more economically produced by this breed than by the heavier. In localities where space is at a premium, where housing must be reckoned by the square foot, where range is divided into small units, and where the active Leghorn still keeps in fit physical trim, we find this breed doing better than the less adaptable varieties.

CARRY EGGS SAFELY The Keipper Way

Fertility and hatching qualities of millions of eggs are damaged yearly by careless methods of shipping. Think of it. Why not save the fertility and insure satisfactory hatches for your customer by using Keipper Non-Shock Egg Carriers? Each egg held in place by rubber bands which prevent vibration in transit, ruptured tissues and injury to fertility.

You Can Safely Guarantee Eggs Delivered in These Carriers
Boxes shipped all assembled ready for use. Strong outer box can be used repeatedly

15 egg size each 35c.	- dozen \$3.00	- 100 \$22.30
30 egg size each 60c.	- dozen 5.10	- 100 38.25
50 egg size each 90c.	- dozen 8.25	- 100 61.00

Remember, above prices include postage PREPAID. Others don't pay postage. Besides our factory at Milwaukee we maintain our own warehouse at Kansas City, Mo., and Fultonville, N. Y., and will ship from nearest point. Order today and be ready. Send for our illustrated catalog and save money. 30 and 50 egg size sold in half dozen lots at dozen prices.

HANSEN'S RUSSIAN ORLOFFS

Undeclared Champions of America. Still stand supreme, winning at the Chicago Coliseum, 1921, 1-2-3 Cocks, 1-2-3 Hens, 1-2 cockerel, 1-2-3-5 Pullet. This win at one of the World's Greatest Shows with the records made in the National and American Egg Laying Contests proves the worth of these great Cold Weather Fowls. My new 1922 booklet describing the Orloff mailed free on request. Am now booking egg orders for spring delivery.

DR. M. A. HANSEN, IMPORTER AND BREEDER, OSAGE, IOWA.

Hatches Now Mean Midsummer Profits and Fall Layers

Quick Shipment— We Pay the Freight

Give me the word "go" and Old Trusty will be on the road to you in mighty short time. We are prepared to make short notice shipments either from the factory here in Clay Center or from our big warehouse at St. Joseph, Mo. And remember, we pay the freight to your station—another saving we make you. Send in your order now and see how quick Old Trusty will be at work for you.

Harry Johnson, "Incubator Man".

Get Your Old Trusty Now—And Make Sure of Big Hatches

Eggs put into Old Trusty now will turn into dollars and cents almost before you realize it. Right now is the ideal time to set eggs to keep the profits coming in steady. Chicks hatched out soon will be ready for the frier and broiler market by midsummer and the pullets will soon after be paying their way in eggs and bringing in a profit besides.

But you can't afford to lose any time in getting your hatches started. And you can't afford to take any chances on the kind of incubator you put your eggs into.

Make sure of big hatches of strong, healthy chicks with Old Trusty. Nearly a million owners are depending on Old Trusty for their poultry profits this spring—many of them for the tenth and fifteenth year.

Old Trusty's big, regular hatches are made doubly sure because of Old Trusty construction. Its pure copper heating system gives an even, easily controlled heat—its clear redwood case with triple walls, top and bottom—keeps heat in and cold out. Its big dependable fuel tank saves time, work and watching. All mean big hatches of strong, healthy chicks from every hatchable egg in any kind of weather. You are sure to find the size Old Trusty you want in the four handy sizes.

Reduced Prices—Send for the Old Trusty Book

Old Trusty will put certainty into your hatching at a time when certainty means much. At the same time you get a bigger, improved machine at a reduced price that you can't afford to let go by.

Mail the Coupon Today

And get the whole story of Old Trusty in our big book. Then you will understand why so many hundreds of thousands depend on Old Trusty for big hatches and get them. But it is more than an incubator catalog—it is filled with common-sense, dollars and cents, practical helps on making poultry pay bigger profits. Get your copy now. Don't delay. Send me your name now and I will see that you get a copy in a hurry.

Yours truly, Harry Johnson, "Incubator Man."

20,000 DAY OLD CHICKS

*For Immediate Special
Delivery Every Tuesday*

from our famous

EGG BASKET STRAIN S.C. WHITE LEGHORNS

Years and years of careful breeding for heavy egg production, large size and beauty, makes them far superior to ordinary Leghorns. They are long, deep-bodied hens with large lopped combs, mated with pedigreed sires and males from high record dams. Our chicks possess the highest standard and egg-bred qualities. Our birds are consistent winners at Laying Contests and leading shows. We won first prize highest individual pullet, 500 birds competing, at Quincy, Ill., for November. Also highest individual at Murphysboro, Ill., contest for December. Thousands of customers testify to the wonderful Egg Laying Qualities of our birds.

Be an intelligent chick buyer this year. Your success depends on it. **Take no chances!** Get chicks from this tried and proven strain and order them direct from the HOME OF EGG BASKET STRAIN S. C. White Leghorns.

EGG BASKET MAID, a Record Layer

PRICES ON OUR EGG BASKET STRAIN CHICKS FOR MARCH, APRIL, MAY DELIVERY

Grade A. Chicks are from selected hens, direct descendants of pedigreed stock. Hens are typetested, selected for large size, beauty, and are high record layers, mated with pedigreed sires of high record dams. These are very high quality chicks. Prices, \$21.00 per 100; \$20 per 100 in lots of 500 or more.

Grade B. Utility mating are high grade selected females. They are the long, deep-bodied, typical birds with large lopped combs, mated with excellent males direct descendants from our pedigreed stock. Prices are \$16 per 100; \$15 per 100 in 500 lots; \$140 per 1,000.

WE GUARANTEE 100% ALIVE DELIVERY POSTAGE PAID

Order direct from this advertisement or send for our large illustrated catalog with testimonials and description of stock, etc. You cannot afford to be without it. Write today.

Chicks ready for Delivery March 1, 6, 13, 20, 28.

IRA C. KELLER, BROOKSIDE FARMS,

Box 75,

PROSPECT, OHIO

This is the main reason why the Leghorn does so well in such points of concentration. This is the reason where the size of the fowls, number of eggs produced per hen, and pounds of feed consumed are the most vital factors that the Leghorn stands supreme. Coupled with the fact that white-shelled eggs on the New York market the year round bring a higher price than the brown ones command, and when a few extra cents per dozen mean much, the difference must be reckoned with.

But we do find, on the other hand, that in those localities where a fair amount of space may be available, where the housing is not so restricted, where the proper care, attention, sympathy and understanding are exercised for the larger varieties, where the demand for hatching eggs, chicks, and breeding stock is active and where prices are fair, the dual-purpose fowls will lay about as well, pay as well, and in many respects be more satisfactory than any of the lighter breeds.

It should not be forgotten that the great bulk of poultry in this country is on the general farms, and the farm breeds are the dual-purpose breeds. A chick from a specialized egg breed like the Leghorn does not afford sufficient raw material. The potential possibilities of such a chicken from a meat market standpoint are not great enough. Men who are in the breeding business have an enormous outlet for stock birds of the heavier breeds. Their business is constant. The highly specialized egg farmer feels the upward and downward trend of the egg market as it fluctuates from good season to lean season. On the other hand, farm poultry is grown close to the source of feed, and the poultry breeder who maintains a breeding establishment, supplying stock birds and eggs for hatching of any one of the popular farm breeds, which are the dual-purpose breeds, is in a very secure position. That is why there are big entries of these breeds in the shows.

Just as in cattle there are two kinds of cattle, dairy cattle kept for milk production and beef or dual-purpose cattle, so in chickens there are highly specialized egg breeds and general purpose breeds. One would not expect to find many beef cattle in New York state. Just as New York is a milk producing state, so is it an egg producing state. But it should not be forgotten that both types of breeds have their place in agriculture. The heavier breeds of chickens will probably always be a farm fowl, and the man who goes into poultry as a breeder will have this wide outlet for stock birds and egg for hatching, provided he takes up one of the heavier or dual-purpose breeds.

The riddle of the breeds boils itself down to a few principles—what are our requirements, what we expect from our birds, and in what manner we may dispose of our surplus products. It is said that there is a "swing" away from the Leghorn. I cannot say as to that. I believe that there are as many Leghorns being bred commercially as ever in the history of the poultry business. But we all realize that the dual-purpose fowls are growing rapidly in popularity. Witness the large entries in the big shows of Reds, Rocks, Wyandottes, many times surpassing the Leghorn entries. Egg-laying contests give us dizzy figures for some of the Reds, Rocks, Wyandottes

Semi-Solid Buttermilk Saves Your Chicks

Rearing Chicks
with
Semi-Solid Buttermilk

by
Prof. HARRY R. LEWIS

Professor Harry R. Lewis has fed Semi-Solid Buttermilk for five years because with it he is able to raise the greatest possible number of chicks to maturity. In his famous 1800 bird Buttermilk Feeding Test started last spring the Semi-Solid fed group showed decidedly the lowest mortality. Out of a hatch of 900 chicks fed Semi-Solid, all but 66 were raised. An outstanding record that can be duplicated by every poultryman who uses Semi-Solid Buttermilk.

BUILDS VITALITY

By feeding your chicks Semi-Solid Buttermilk you provide them with a vitality that helps keep them free from disease. White Diarrhea and other stomach troubles never worry the user of Semi-Solid Buttermilk. Professor Lewis proved that Semi-Solid Buttermilk provides the vitality-increasing lactic acid found in Buttermilk in its most efficient form.

Semi-Solid Buttermilk is pure pasteurized buttermilk. It will keep. Every poultryman knows that buttermilk raises better chicks. The report of Professor Lewis' test shows that Semi-Solid is not only the *most valuable* form of buttermilk—but *the cheapest*. Added to the ration in limited quantities Semi-Solid makes the chicks eat more feed and grow faster. Professor Lewis proved that feeding Semi-Solid Buttermilk cuts in half the number of culls.

WRITE FOR Prof. Lewis' Book and Free Sample

Professor Lewis said "Every poultryman should use Semi-Solid Buttermilk," after he had demonstrated that the flock fed Semi-Solid made the biggest profit. The Semi-Solid group, which made this wonderful record, received only a home mixed ration. The report includes the feeding formula. If you are using prepared mash feeds, those which contain Semi-Solid Buttermilk naturally bring the greatest profit. You increase the value of your ration by adding Semi-Solid Buttermilk, because it is milk in its most efficient form.

Professor Lewis' report is complete and exhaustive and covers the rearing of chicks from the brooder to the laying pen. It contains fundamental discoveries of the utmost importance to every thinking poultry raiser. This book and a sample of Semi-Solid Buttermilk, the same as that used by Professor Lewis in this phenomenal test, will be mailed you on request. Please give your dealer's name and address.

Semi-Solid Buttermilk is put up in packages to fit the size of every flock. Thousands of poultry raisers know that they can not afford to do without it. Write us and we will show you how it will increase your profits.

Agents Wanted

Write TODAY for our agency plan which explains how you can get an ample supply of Semi-Solid Buttermilk for your flock FREE. Agency territory includes only states west of Pennsylvania, and east of the Rockies. A postal card will bring it.

The Buttermilk Producers, Inc.,
110 South Dearborn Street,
Chicago, Ills.

Gentlemen:—
I must write you about what Semi-Solid Buttermilk has done for me.

Bowel trouble was held in check so that I lost only seven out of ninety. Those I now have are much over 3½ lbs. at 17 weeks and are still growing.

Then, too, my birds are—so it seems to me—more active, better feathered and sharp-eyed, etc., than any of my neighbors. I am very sure my birds will be ready to shell out eggs before any of my neighbors' and that the male birds will be ready for the table or sale before my friends'.

I want to state that this "boost" is entirely of my own volition; Justice where Justice is due.

Semi-Solid is all that one desires and I would advise anyone—particularly a beginner—to try it. Yours truly,

Edgar
Moore,
Sharon
Hill,
Pa.

Without this label it is not Semi-Solid.

Keep Down the Louse Pest

IT means better fowls, more eggs, better growth in chicks. Chicks are coming along now. Don't let them be pestered to death. Sprinkle Dr. Hess Instant Louse Killer in the feathers, in the nests, on roosts, about pens, coops and yards. Be sure to keep it in the dust bath all the year 'round. That means louse prevention. When setting the hen sprinkle it in the bottom of the nest before adding the litter and the eggs. Then your brood will come off free from lice.

An excellent bug killer to use on cucumber, squash, and melon vines, slugs on roses, etc. Guaranteed.

JOHN L. BROWN 65 Indiana Ave. ANDERSON, IND.

Huston's White Orpingtons

L. L. Huston, Proprietor. 200 Harrison Blvd., Oak Park, Ill.

1921 winnings National Poultry Show: 1st Cockerel, 4th and 5th Pullet, 3rd Young Pen, and 5th Cock;
1922 winnings: 2nd Cock, 5th Hen, 4th Cockerel, 5th Pullet, in strong competition. Stock and Eggs for sale. Satisfaction guaranteed.

and Orpingtons, not alone for individual records, but for pen units. A revelation to many people who considered the Leghorn supreme in the "egg-laying" business.

It is said in Boston that the quality and size of the table fowls received there is not up to the standard of some years ago. The soft roaster, the stewing hen is not up to the desires of the more particular customers. Perhaps, in developing the egg-laying qualities of the dual-purpose breeds some of their excellent table characteristics are being overlooked or bred out of them. This would be both a pity and a serious mistake. Given a dual-purpose fowl, showing a good production in table eggs for the year, a good hatchability of its eggs in the breeding season, a good return as either a breeding specimen or a table bird, and we have a combination very hard to surpass. Let each variety be bred and developed along its natural lines, and we will find profits in abundance for all—whether we keep Leghorns in Petaluma or Reds in Rhode Island.

Little Chicks Need Care and Protection.

(Continued from page 311)

grain is scattered in the litter on the board floor, morning, noon and night.

The pen doors are opened and chicks are let in on the dirt. A little grain is raked in to induce them to scratch.

After the second week grain is fed only once per day for the evening meal, scattered in the litter. A little grain is also raked into the dirt for the next morning. Oat sprouts are fed at noon. Later on, if the season is not too early, oats are grown in the pens and the chicks let in to eat the tops and dig for the tender roots.

The brooder house is now a very busy place. The chicks have acquired the habit of eating and exercising that makes for vigor and resistance to disease.

From such a flock comes the high producing hens and the vigorous males to carry on the line.

Sour milk, because it is not easily obtained, is not fed. Boiled eggs used in many feeding programs have no place in the one here followed.

Wet mashes and condiments are never given to either young or old stock. Wet mashes would induce the hens to lay another egg or two; tonics might also do so, but we feel that the flock will be a better one this year, next year and the years to come, if required to respond to reasonable demands. We have often seen the efficiency expert take a good 100 percent hired man and in the endeavor to make him deliver more would wear him down to a 75 per cent producer. This truth of human effort is ditto in the case of fowls.

But let us get back to our brooder house. For the framing "edgings" are used, waste strips from the saw mill rip saw table, where lumber is sized. Light pieces of "edgings" may be purchased very much cheaper than three-fourths by two or other sized strips. The frames for covers and ventilating screens are easily put together.

The sketch shows how we fasten them with double-pointed tacks. They don't look like they would hold but they do. The double-pointed tacks are used to tack down the netting. They are used

also with the wire hinges, which we make and which are just as satisfactory as those bought at the hardware store.

The sketch shows three suggestions for hinges. The tacks are not driven quite down on that part of the wire forming the hinge.

If we have not said that our houses are kept clean and free of mites and lice we'll say it now.

In the winter, sifted ashes are put in the pens for the hens to wallow in. At the beginning of the next brooding season the dirt may be removed.

Healthy Land Underlies Healthy Poultry.

(Continued from page 310)

presence of the worms may be seen.

The eggs of these parasitic worms live for remarkably long periods of time and under a varying set of conditions of cold and heat, dryness and moisture. In this bit of knowledge we find the reason for the persistence of the infestation and the difficulty of the problem of control. The worms, in a word, break down the natural health and strength of fowls, gradually destroy the powers of egg production, and in many cases finally cause mortality. These worms may be found on very new poultry soil, but usually they are to be found on those soils which have seen several years' usage as poultry runs.

Second, chicken-pox, roup, and canker have secured a foothold in some poultry flocks that has been and is hard to loosen. Indications are that this infection is more or less tied up with the over-use of land for poultry. Crowding and over-intensification certainly is increasing these diseases. They are lowering egg production and killing many thousands of fowls annually. They are caused, probably, by organisms, microscopic in size, the identity of which we do not know at present. That these germs infect our soils, runs, and environments is scarcely to be doubted. It may be that these diseases are held over and maintained by agencies that we little appreciate in our present understanding.

Third, coccidiosis is a formidable poultry disease that has broken out on those poultry farms where over-use of the soil, without proper treatment has been practiced. It is a disease largely of growing chicks, but it attacks mainly where the runs are old and birds have been allowed to run over them continuously. It seems as though this disease were more or less closely tied up with the worms and other parasites. In fact these poultry diseases are possibly closely interlocked, inter-dependent. One may be expected where another is found.

Fourth, disease germs of various kinds, other than those specific types mentioned above, are infecting the lands and soils and causing ill health and lowered production.

These are four of the things that are looming up as being factors of serious consequence in the soils and lands that have been over used. There are others. When conditions become serious enough to establish one of these others quickly follows. It is against these, and similar serious elements, that we must take issue.

What Can Be Done About It?

I do not know that we are in a position to give concrete advice as to ways

(Continued on page 364)

Grow All Your Chicks Make Them Husky

It costs money—in eggs and time—to hatch chicks. If you lose most of them after they're hatched, you lose just so much real money. And if it's too late to replace the early hatches—your season is ruined. If you are to make a big success *you must raise the chicks*, grow them into fine-quality table birds or husky, persistent layers.

The real danger lies in the critical first few weeks after hatching. Give the youngsters a strong start—with digestive organs working right and every part developing normally—and you can easily carry practically every one of them to profitable maturity.

Pratts Buttermilk Baby Chick Food

the original "Baby Food for Baby Chicks" does just this.

Containing every food element needed to build bone, muscle and feather, its use insures even development. Being ground to extreme fineness, it is "mechanically predigested" and takes the strain from the organs of digestion. A large proportion of buttermilk—in the finest form—provides flesh and bone-building materials and the lactic acid that has such a favorable effect on digestion and intestinal disorders. And—this is important—but a very small percentage of crude fibre.

Pratts Poultry Regulator

should be added to the regular ration after the youngsters are weaned to keep them healthy and vigorous—to insure steady, rapid growth. Save Money! Buy Pratts Poultry Regulator in 12- or 25-lb. pails; 50- or 100-lb. bags.

"Your Money Back if YOU Are Not Satisfied."

One of the 60,000 Pratt dealers is near you.

Quincy, Ill.

Lake Andes, S. Dak., Jan. 9, 1922.

Gentlemen: I got two of your Sol-Hot Canopy Brooders last year, one 250 chick size and one 500 chick size and have used brooders a number of years, but never had the success that I had with yours.

Yours very truly, Arie Dykstra

* * *

H. M. Sheer Co.,
Quincy, Ill.

Lakewood, Ohio, 11-28-21.

Gentlemen: I received the two brooder stoves last week and set up one of them, and will say, they are 20 years ahead of last year's model. I can recommend your brooder to anybody.

Yours respectfully,
Alvin E. Krauss.

* * *

The H. M. Sheer Co.,
Quincy, Ill.

Somers Point, N. J.
Nov. 28, 1921.

Gentlemen: Last April I bought a Baby Sol-Hot Brooder from you. I placed fifty-two baby Leghorns under it and raised every one of them.

I never had any experience with brooders before and I'm away every day, so the brooder had to take care of itself.

Respectfully yours,
H. T. Marstetter.

* * *

Dear Sir:

Hudsonville, Mich., Dec. 5, 1921.

I purchased one of your brooder stoves last year which was excellent. Several of my friends who seen it in operation, were much impressed with it.

I don't see how you can improve them any, as all I did was fill the jug for three weeks straight running, and clean the burner, although it really did not need it.

A very satisfied customer,
D. L. Stevens.

H. M. Sheer Co.,
Quincy, Ill.

Oakley, Kan., Dec. 12, 1921.

Gentlemen: Please send me your catalog folder. Used one of your brooders last year with splendid success, will need another for the coming season.

Yours truly, Jim O. Cline, R. R. No. 3.

* * *

H. M. Sheer Co.,

St. Joseph, Mo., Feb. 13, 1922.

Gentlemen: As I will be in need of some kind of heat for chicks, and as I have used one of your Sol-Hot lamps and find them O. K., I would like to have you send one of your catalogs and prices.

Yours very truly,

E. T. Brooks, 804 So. 30th St.

* * *

H. M. Sheer Co.,
Quincy, Ill.

Messena, Ia., Feb. 11, 1922.

Gentlemen: I received your prices and circular on your Sol-Hot hovers some time ago. If you have any inquiries from this part of the country, refer them to me, and I will call on them at once and explain the machine in detail and give them a demonstration. I have got as much as four days and four nights continual running on your 32 inch brooder with one gallon of oil. I think this is a feat that is hard to beat with any other hover, especially so when you keep the temperature between 85 and 90. Send me more circulars on the hovers, also on your incubators.

Very truly yours,

L. R. Anstey.

H. M. Sheer,
Quincy, Ill.

East Alton, Ill., 2-11-22.

Dear Sir: Your guaranteed this little Super Sol-Hot Brooder to give me entire satisfaction, so I think I ought to let you know whether it is doing it.

Super is right. It is Superior to anything I have ever used, but the natural old SOL would have to get straight up and quit changing his latitude before he could produce the good, steady glow that this little Super does. It knows no winter. A sudden change of weather has no effect on it. It is always on the job, and always the same. I lighted the burned two weeks ago, and have never done anything to it since, except to feed it a little oil once a day, and it has never varied one iota. It takes about two minutes of my time each day to put oil in the tank. Perfect ought to be its middle name. Would suggest that you call it Super Perfect Sol-Hot.

Yours truly, D. C. Brown.

and means of controlling a situation that is appearing just as sure as taxes. These persistent problems have comparatively recently engaged our sober attention and thought. They offer the poultrymen problems that must be studied and overcome as soon as may be possible. But what can be done now, you ask?

First, realize that no permanent system of poultry keeping can be built which does not take into consideration the fact that the soil must receive real and consistent attention, that fowls cannot be allowed to run over the same land year after year without change.

Second, rotation of crops which will keep the fowls off certain parts of the land for some time, perhaps a season, must be more seriously practiced.

Third, in the more intensive sections where the acreage is very limited and the number of fowls is large the surface soils must be heavily limed and turned under to a depth of six or eight inches.

Fourth, new flocks of baby chicks this next spring should be reared on new land that has not been growing chicks in very recent years, if possible, or on land that has been heavily limed and deeply plowed. Fresh soil is all essential.

Fifth, constant and strict sanitation and disinfection of the winter quarters of layers and breeders must be practiced, to aid in destroying in so far as may be possible, the infection and infestation that might otherwise be carried over the winter.

What Does It Mean?

I do not mean to be an alarmist, but I do believe in preparedness. We do know that many poultry keepers are suffering large losses, due to worms, diseases of various kinds, and maladies of many sorts. To fail to face the realities of the case will never result in eradication of troubles. We cannot expect to correct or control serious situations as are brought about when these scourges greet us, by administering sugar coated pills. It seems to the writer that fundamentally all poultry raisers must look to the soil, the land, its area, its type, its texture, its drainage, its surface condition, and its biological life, if he would remove these troubles by the roots, and thus eradicate them forever. Our systems of poultry keeping must consider the importance of the soil, or land. These systems may be intensive to the nth degree, but with that practice must go certain, proportional consideration for the soil. We cannot expect to go on indefinitely raising fowls and getting successful results and making profits, if we fail to read in the persistent problems we meet certain danger signals. Danger signals are always, or should always, be warnings given in time to avoid accidents.

Two Eggs a Day.

Columbian Plymouth Rock No. 161 entered in the Storrs, Conn., egg laying contest by T. J. Enslin, New Jersey, laid two eggs in one day and in fact laid the two eggs within an hour. This is an exceedingly unusual performance. Many cases of two eggs a day are reported, but the evidence is often circumstantial. Furthermore, it is usually assumed that one egg is laid early in the day and the other late, whereas, in the cases actually observed at Storrs, where a hen lays two eggs in a day they are usually produced quite close together in point of time. For example, a White Leghorn in the contest was once observed by three attendants to lay two eggs, one within three minutes of the other.

Lectro-hatch

ELECTRIC BROODER

**No work. No worries. No crowding.
No fumes. No hot or cold spots.**

Electric heat in your brooder does away with all filling of lamps, trimming wicks, shoveling coal or carrying out ashes.

There are no fumes, no smoke. Your chicks breathe fresh, pure air all the time.

And it is so easy, so simple for you. Connect the Lectro-hatch Brooder to any electric light socket and turn an adjusting nut until the thermometer shows just the temperature you want. Then your worries are over.

Night or day, the temperature in your brooder never changes, but holds steady and even, right where you set it. That means no ups and downs in temperature—no frozen or roasted chicks.

What's more, the heat is uniform in all parts of the brooder. There are no hot spots and no cold spots. Chicks don't have to crowd together and trample each other to keep warm.

Big, Strong Chicks

Pure air, unchanging heat, and no crowding will prevent a big part of your usual chick losses. And every chick will be healthier and will develop more rapidly. You will have more and better fowls.

Costs no more than burning oil, and

usually less. But, oh, what an enormous difference in size and vigor of the chicks, in cleanliness, in safety, ease, convenience and peace of mind. Operates from any electric current—from farm lighting plant, traction line or town lighting system.

Strongly built of galvanized iron, with wool felt curtain. 500-chick size, \$23.50; 150-chick size, \$16. Order from this, or write for any information desired. When ordering tell us the voltage of your electric current.

Hatch With Electricity!

Lectro-hatch Electric Incubators have the same advantages of pure air and steady, even heat without bother or watching. You get bigger hatches of better chicks. Day-old electric hatched chicks have the appearance of being a week old. We also furnish electric heating elements for converting old incubators into electrics. Easily installed at small cost. Write for full information.

Electric Controller Co.

423 E. 10th St., Indianapolis, Ind.

Everything in Ship-Shape for Spring Work.

(Continued from page 309)

Having now fixed up the house or pen, and the chickens, you must look to your yard. As a rule, with back-lotter's the yard is but small and continual use by the flock has, in all likelihood, beaten it solid and the ground is sour and sticky. The ideal sweetener of soured ground is to raise a crop. If you are lucky enough to have two or more yards, alternate from one to the other, raising a crop of oats in one while running the chickens in the other. But if you have but the one yard, first cover it with a good coat of air slacked lime up to half an inch thick, if necessary. Then spade the ground a foot deep, breaking up all the clods and mixing the lime through it all thoroughly. While spading up the ground and breaking the clods, mix in a quantity of grain to encourage scratching. Air slacked lime is nothing but ordinary quick lime exposed to the air until the lumps fall apart and into a fine powder. You can hasten this condition by keeping the quick lime in the cellar. The dampness in the cellar hastens the process.

In one end of your yard have your dust bath. It is now spring, and placing the bath outside keeps down the dust in the pen proper. Make it good and big to give the chickens ample room. You must protect it from the rain and high winds by a roof and a side on the end where thunder storms usually form. Fine coal ashes will answer very well, although not as good as road dust. The trouble with road dust now, however, is that the constant passing of automobiles and the consequent splashes of oil generally spoils it for poultry use. We don't want oil smeared chickens. If you can buy any tobacco dust cheaply, add that in the bath.

Feeding for Hatching Eggs.

Many people have asked me for advice as to feeding for strong hatching eggs. Many also want to know if you can have strong hatching eggs when the flock is confined to a small yard as in the case of the ordinary back-lotter.

Taking up the first question—feeding for strong hatching eggs—I can only say that with the exception of adding a little more corn in the ration in very cold weather in the winter to furnish the extra heat requirements of the chicken, I never change my feed. I know this will be looked upon by many as poultry heresy, but I have tried many experiments in my over thirty years of poultry keeping, and, in my judgment at least, I believe I know whereof I speak. I am not one of those, however, who always believes the other fellow always wrong and myself always right, so I want to present my side and then you must use your own judgment.

We are told my many breeders that when we force for egg production, the hen loses its vitality and the egg its strong hatching qualities. As an illustration of this point, it is pointed out to us that record breaking hens very seldom lay an egg of strong hatching qualities. Just where they get that word forcing from, I could never see. If they feed a balanced ration, that is, a ration containing the constituent parts to form an equal number of both the

You Need this Handy Sprayer

Use the Auto-Spray No. 1 to disinfect incubators and brooders and to clean out lice and mites in the poultry house. Prevent blights and destroy insects in the hot house, cold frame, garden and on the lawn.

Whitewash the cellar, stables and other outbuildings faster and more evenly than with a brush. Wash windows, buggies and motor cars quickly and thoroughly. There are nearly 40 other styles of Auto-Spray—big and little.

"It's a Life Saver"

—Says a Prominent Poultryman

Herbert H. Knapp, Shelby, Ohio, former President International Baby Chick Association, writes:

"In our own plant we found Conkey's Buttermilk Starting Feed a life saver. Not a single case of White Diarrhea this season. Your chain of feeds was a happy thought. Three Buttermilk Mashers for Starting, Growing and Laying are complete and surely do bring results."

Buy It by the Bag

Conkey's Buttermilk Feeds are sold at dealers carrying poultry feeds and supplies. Be sure to get them in the original packages.

Conkey's

The Original

Buttermilk Starting Feed

1. Conkey's will prevent your big losses of little chicks, due to weakness and disease.
2. Conkey's will give your chickens that quick start in growth that is necessary to insure early broilers and layers.
3. Conkey's will help prevent White Diarrhea, as the lactic acid in the buttermilk used by Conkey's acts as an "intestinal broom," which helps to sweep away unfriendly bacterial disease germs in the delicate digestive tract.
4. Conkey's is low in fibre and just right in protein, scientifically correct. Does not injure or overtax the sensitive digestive apparatus.
5. Conkey's is the only Buttermilk Starting Feed made by the Conkey Original Process, in which the buttermilk is thoroughly incorporated with the other ingredients. We use semi-solid buttermilk only.

Conkey's is different—it is so clean, sweet and genuine. No mill ends, shriveled or unsound grain, weed seed or mill sweepings used—only the best and purest grain. Yet it costs so little for those first eight weeks, no poultryman can afford to be without it.

Don't Break the Conkey Chain of Buttermilk Feeds

There are three of them—one each for Starting, Growing and Laying—each the best for its particular purpose.

After 8 weeks, feed Conkey's Buttermilk Growing Mash. Any feed that is sold for both starting chicks and growing them beyond the first eight weeks is unscientific and unsafe. If your dealer cannot supply you with Conkey's Feeds or Remedies, write us and we shall see that you are supplied.

The Conkey-Norwich Chick Feeder-Fount

is the most satisfactory device ever invented. Keeps feed clean and prevents chicks from wasting it. Used for fountain also. Ask for circular.

Free-Conkey's Poultry Book

80 pages full of information about the feeding and rearing of chicks, culling of hens, etc. Tells how to keep chickens healthy and how to make them pay. Whether a beginner or a professional, Conkey's Book is worth dollars to you. Sent for 6 cents in stamps to pay postage.

THE G.E. CONKEY CO. 6531 Broadway, Cleveland, O.

Feed It for the First Eight Weeks

When the chicks are hatched, give them clean water with the chill taken off and fine grit, but no feed for 48 hours. Then feed Conkey's Buttermilk Starting Feed dry, often but sparingly for the first few feeds, so they will clean it up, gradually increasing and continue for eight weeks, with occasionally a little green food. If you do this, you should lose very few chicks on account of sickness.

"Nothing Equals Conkey's"

U. R. Fishel, the well-known breeder of White Plymouth Rocks at Fishelton Farms, Hope, Indiana, writes: "Conkey's Buttermilk Starting Feed is the best feed for young chicks. I have found nothing to equal it in the 40 years I have been in business."

KEIPPER COOPING CO. INC. 1401 1st St. MILWAUKEE WIS.
EASTERN OFFICE. JOHNSTOWN. NEW YORK

whites and the yolks of an egg, I could never understand where the force came in when we left it entirely to the natural inclination of the hen and to nature whether it laid an egg or not. If there was some way in which we could unnaturally force it to lay the egg, and if that method was used, then I could see the danger in doing it. But when we only give it the food to allow it to lay the egg, if the hen and nature so desired, force seems a word out of place and not in accordance with the facts. And when they cite the record breaking hen as their example, I have always looked through the article to find out if the other hens in the same pen also laid poor hatching eggs. But this information is never given.

What I do know is this, that in my thirty years or more experience in the business I have had many 200-egg, and over, hens, and I found no more difference in their hatching qualities than in the eggs of the poorer stock. Some of the best hens I ever had laid poor hatching eggs, but they laid this kind of eggs whether I fed them balanced rations or not. And, on the other hand, some of the best hens I ever had and which would have held high place in any egg laying contest, laid just as good and strong hatching eggs as any hen I ever owned.

I know that I have now several hens that have laid very close to the top-notchers in the present egg laying contest that I sell their eggs for hatching and guarantee a 90 per cent hatch and they invariably hatch very nearly every egg. So that I never believed in the theory that to secure strong hatching eggs you must cut down their egg production. But if you believe in it, it is an easy matter to reduce the egg laying. Simply disturb the even balance of the feed so an equal number of whites and yolks are no longer possible and you will soon have less eggs.

Free Range.

Another seemingly well established theory to which I do not agree is the necessity of having free range for the stock before strong hatching eggs are procurable. This, too, I have found to be untrue. I guarantee the hatching eggs I sell to hatch 90 per cent, and I am seldom called upon to replace any eggs. And the chickens that laid them were never out of a 5x8 foot house with a 5x10 foot yard attached. Their fathers and mothers, and their grandfathers and grandmothers and generations before that were never out of the same kind of a pen. And I challenge any breeder to show me any healthier, sturdier, finer or better chickens, chock full of life and vitality, than are mine.

What does free range give a chicken that it can't get in your back yard plant? Not a single thing. The truth of the matter is, the only difference between a back-lotter's plant and free range is that with free range the chickens are more likely to get the needed exercise. It can't be anything else. They get just as much fresh air in a small yard as in a field of many acres. You feed them a meat supply and a green food supply in the small plant that they get on free range, and it is likely to be better food at that, too. So that it all simmers down to the fact a hen will likely get more exercise on many acres than in a 5x10 foot yard. And if this is the case, it

MR. POULTRYMAN

Play Safe This Year

There is more profit in buying well bred chicks, even at two or three times the price, than taking chances of ruining your whole year's business with hap-hazard bred stock.

Lord Farms Leghorns

will cost you a few cents more per chick than the cheapest you could buy, but don't save dimes this Spring and lose Dollars and Dollars next Winter. A poor man can't afford to take chances in cheap stock. Lord Farms strain of Leghorns have cost us thousands and thousands of dollars to produce, yet they are the cheapest chicks you can possibly buy.

Lord Farms Grade A Chicks

are all from one strain. The eggs are all raised on the Lord Farms from hens that have each and every one been tested by the State for white diarrhea. They have been bred for generations from American bred stock, for good size, good looks, the greatest of vitality, and are producers of good sized white eggs in quantities that make a poultry farm profitable.

For years our customers have been reporting wonderful egg yields. The past season exceeds all previous records. Lord Farms Leghorns are steadily being improved year after year, and our crop of 1922 chickens should exceed all previous matings.

 If you are going to buy a few hundred or a few thousand chicks this year, send the Lord Farms at least part of your order; toe-mark all your chicks and compare them with any other strain of Leghorns you can buy for actual dollars and cents earnings. Just keep track of what the chicks will cost you. Compare the mortality of the Lord Farms chicks with any other strain, compare their winter laying qualities, then the actual amount of eggs they produce in a year, and take in to consideration the superior size of the Lord Farms eggs. Compare them with any strain you can buy as "Money Makers," and we think you will become a permanent Lord Farms customer.

is your own fault and don't blame the plan—blame yourself.

If you feed your grain in your back yard plant in deep litter as you should, you will get just as good results as on a 1000-acre farm. If you don't feed them in this deep litter and thereby furnish the required exercise, your hens will get fat and lazy and the eggs poor in quality and few in number. If you feed the right food and in the right manner, there is no reason in the world why your back yard plant eggs should not hatch just as well and produce chicks with just as much vitality as those produced on free range. I can do it, and do do it. So can you.

The Incubator.

Having now fixed up the pen itself, the yard and the flock for the spring season, the next step is to get ready for hatching. This, of course, means the incubator if you are raising the non-setting variety of chickens. And even if I had the breeds of chickens that do set, I would use the incubator anyhow. When one has valuable eggs on hand he cannot afford to leave them become stale and weak from long keeping, waiting on a clucky hen. And don't let anyone tell you that chicks raised by Old Biddy are any better than properly incubated incubator chicks. They are not. But remember those qualifying words, "properly incubated." They mean a great deal. But you can just as easily "properly incubate" the eggs as to do it improperly.

First of all, properly clean the incubator. Dust and filth in an incubator will injure the eggs. The dust will close up the pores of the eggs and the filth will foul the air. If you are a beginner in the business, never set a single egg until you have had the incubator running perfectly, night and day, for at least three or four consecutive days.

Where will you place the incubator to do the hatching? A great deal depends on this, especially for a beginner. The principal thing is to have it where the temperature varies the least, night and day. Naturally that would seem to be in the cellar. And the cellar is the best place if it is one where you are always assured of a plentiful supply of pure air. If you have a furnace in the cellar, can you so run the furnace that it will give forth no coal gases. If you can, well and good. But if you can't, remember that the growing chicken in the egg needs pure air just like you do yourself and just the same as coal gas will kill you, just so it will also kill the developing chick, and less of it is required for the chick than for you. Here is where the advantage of raising Leghorns comes in. The best time for setting the incubator for Leghorns is from the beginning of April through the month of May and the furnace fires are probably out by then. With heavier breeds, of course, such is not the case, the best time to set their eggs being in late February or very early March. So that with Leghorns, the cellar is the ideal place if the furnace fire is out or if you can fire the furnace without noxious coal gases. And see that your air is not stagnant air. This doesn't mean that you must have a draft of air, but it must continually change so the air is constantly renewed. If you do not have such a cellar, the next best place is a room as far from the heat

HATCHING EGGS

For the season of 1922, I have mated up 20 wonderful matings from which I am pleased to share eggs with those seeking the best in Barred Rocks. In the past, my matings have produced birds which have swept the decks at the very largest shows in the country, my latest win being every prize but third cock bird and fifth hen in the strongest quality class of the season, Washington, D. C., Thanksgiving Week.

And what is of still more interest to you, they also produce winners for my customers.

Dunnellen, N. J.

Dear Sir:

From the setting of eggs, I purchased from you last Spring, I had four cockerels; one of them won first and color special at the New Jersey State Show being held in Newark this week.

C. C. Dunham.

plant of the house as you can get it. A kitchen is the worst possible place in the entire house. Hot and steaming during the baking and cooking hours, then cool or cold at other hours makes it almost impossible to regulate the incubator correctly and means failure.

Pick out a room where there is the least possible change in temperature, day and night, even if it is a very cold room. If possible, do not have it on the sunny side of the house. The sun itself causes a great change in temperature. If you must use a room on the sunny side, close out the sunlight in some manner. You don't need sunlight to hatch the eggs. Having now picked out the room, set the incubator up in the place you intend it to stand until the hatch is entirely over. Now level it up. This doesn't mean have it pretty nearly level, but level. You can buy a good enough level in the 5 and 10 cent stores for a dime. And it doesn't mean level it up on one side only and have the other end lopsided. It means level on all four corners. If you have a hot air incubator and do not have it perfectly level, as hot air rises to the highest point, you'll have the eggs in one corner overheated and in the other corner underheated. If you have a hot water incubator, and not level, the water won't circulate evenly, you'll burn more coal oil to secure the right heat, and will par boil or bake some of the eggs and chill the others. Remember, therefore, it is vitally important to have the incubator perfectly level on all sides.

Now get it going. Don't expect a cold incubator to heat up in a few minutes nor in a few hours. Some take half a day or more until the chill is taken out of the wood of which the incubator is made, and the heat begins to heat up the inside of the incubator so it will show on the thermometer. I remember well my first electric incubator—a wooden 150-egg size. I started the current on it on Sunday morning full blast. Hour after hour went by without the mercury even showing in the thermometer. I moved the current regulator to the last notch and yet on Sunday night no movement could be seen in the mercury. I gave up in disgust, but left the current on. Monday morning the top of the thermometer was burst off by the rising mercury. Goodness knows how much heat was in that incubator. And yet it was one of the best incubators I ever had. Don't hurry the first heating. Use a reasonable flame and give it plenty of time. After it is heated through and through you'll have no bother.

After it is thoroughly heated up, begin the regulation of it. Keep changing the regulator until it runs regularly at 102 degrees, but allow several hours to intervene between every change of the regulator. This is necessary to allow the heat to have time to adjust itself to the new regulation. Have it finally so it will keep 102 degrees with the damper from an eighth to a quarter of an inch above the heat supply pipe. Some incubators have regulators that raise more than others and you must judge of the proper height. There is a reason, and a most important reason, too, for not having it any higher. A warm spell may come suddenly while you are away from home and the damper should have all the room it can to raise to let off the excess heat. If you have it run-

The Magic Brooder

The Wonder of Wonders

No person can ever realize the efficiency of this brooder until they try it.

Many people think "a brooder is a brooder" and one should be as good as another. A brooder that will not hold the fire nor maintain an even temperature will not do the work properly.

The Magic is built to do the work. It is equipped with both top and bottom draft regulation, also coal magazine and gas escape system. The ash pans are made of galvanized steel and will not rust out. The deflectors are lock seamed and riveted. In fact, everything about the Magic brooder is quality from start to finish. They need attention only twice a day and will brood chicks at a profit. Without a reliable brooder it is impossible to succeed. Money refunded after thirty days' trial, including freight if the Magic brooder does not do all we claim. Send for free catalog describing same, together with plans for colony and laying houses.

UNITED BROODER CO., 348 Pennington Ave., Trenton, N. J.

ning regularly so it stands high above the heat pipe, it cannot raise enough to let off the surplus heat and your eggs roast. Whereas, if but slightly raised when running regularly, in all likelihood the extra distance it can raise will carry off the excess heat and save the eggs. It is true that when carrying the damper as I advise, a sudden cold spell may also come and then even when the damper drops down all the way the thermometer will not register the required degrees. But it is a thousand times better to run the risk of too little heat than too much heat—the one simply delays the hatching of the eggs, if not too long continued, while the other roasts the eggs and they will never hatch.

You will notice in several places I place great stress on the matter of having it so regulated before setting the eggs that it runs perfectly, day and night. You may have your incubator running perfectly all day, but with the night air usually comes a colder temperature and you must provide for this. You must learn to judge by the weather outside if it will be necessary for you to slightly raise the lamp wick and furnish more heat for the night. That is why I advise you to run the incubator for quite a few days before you set the eggs. Before you start the hatch, have it so regulated that it keeps the 102 degrees for three or four consecutive days. When you can do that, you are safe in trusting valuable eggs to its care—not before.

We now have the incubator ready. If it is to be filled with Leghorn eggs it will be at least April 1 before you will begin the hatch and on that date you will find in the American Poultry Journal our method of hatching and rearing the chicks.

Food values for Growing Chicks.

(Continued from page 307)

corn alone is sure to result in yellow plumage. We had a flock of White Leghorns raised on a farm. A part of the flock stayed close to the barn and ate freely of yellow corn as it was hauled to the barnyard for the hogs, while another part of the flock roosted in the orchard and during the day ranged in the grain fields. It was easy to tell from the color of these birds just where they had been feeding. The next season we took two of the yellow male birds and during the molting season fed only hulled oats, wheat and cracked white corn and they made white cock birds. It is foolish to say that a bird that is bred white will be white regardless of feed. We have tried it and we know whereof we speak. Hulled oats are not only an excellent bone and body builder but they help to develop a nice plumage. Hulled oats and milk surely do make the birds grow.

A Word About Leg Color

Birds that have been fed in this manner will be very white and have a very luxuriant plumage so that a four and one-half pound cockerel will have the appearance of a bird much heavier, but unless the green feed is well supplied there is liable to be a lack of color in the yellow leg varieties. Birds kept on range rarely are lacking in color of legs but those kept in close quarters are liable to have light yellow or lemon colored legs. The plumage of a white bird can usually be guessed by looking at the

legs, for it is difficult to get a chalk white bird with deep yellow legs.

The color problem is mighty interesting, for we not only want white birds to be white but a nice gloss adds to the appearance. Oily substances added to the diet when the fowl is finishing helps to put a gloss on the finish. By the method I have described your pullets can be kept growing a longer time and when finally matured make larger and better females. Avoid rich, stimulating foods that hasten early maturity in your best females. The precocious pullet that lays at five months rarely amounts to much as a breeder.

There is a striking similarity between the foods and care demanded by a chick and that demanded by a child. Chicks, like children, demand rest and warmth for a few days after birth. The one difference is that the child requires nourishment at regular intervals, while the chick has absorbed sufficient food in the form of egg yolk to sustain it for the first two days. If the child is kept warm and nourished with plenty of digestible food it will sleep a good portion of the time, and this is an indication of a healthy baby. Babies do not cry just to hear themselves cry neither do chicks unless they are hungry or cold. Therefore, the two prime essentials for chicks and babies are warmth and proper food and fresh air. Food that merely sustains life is not satisfactory. Many poultrymen seem to think that their fowls are doing well because they are living, but it is not sufficient to keep the chicks alive; they must be kept growing constantly from shell to show room, or frying pan, whichever their destination may happen to be.

People are only beginning to get interested in proper food values. When parents are indifferent about the food given to their children, we can not expect them to seriously consider the food given to their fowls. Very many diseases are directly traceable to diet in one way or another. In some cases the wrong food is used and in other cases the morbid condition is caused by over-eating or malnutrition. Our public schools have recently given attention to this subject. Teachers and superintendents have discovered that many pupils are unable to make the grades because of the fact that they are not properly nourished, yet the parents of these children think they have abundantly provided. In most cases no doubt an abundance has been provided, but not in a form that can be easily and adequately assimilated by the child. An active brain demands a healthy, well nourished body, and so we have nutrition classes for the duller pupils and warm lunches for the elementary grades. The child can not do its best unless it has the best food. It needs the best food that it may have an active mind and a body capable of resisting disease, and the chick needs the best food so that it may develop into the largest and most beautiful and vigorous chicken, the most active egg machine.

The hatching season is at hand and the following hints will be found helpful: Collect hatching eggs often. Hold at temperature of 50 degrees. Do not incubate eggs more than ten days old. Operate incubator in basement or cellar. Set incubator perfectly level. Provide good ventilation. Avoid drafts from windows and doors. Regulate carefully before putting eggs in. Operate according to manufacturer's directions.

Order Needed Machines NOW And be *READY*—with NEWTOWN COLONY BROODERS

when the first hatches arrive. You want to "raise the most chicks, the best chicks, with least labor and at lowest cost"—you can do it with Newtowns. That's why successful chick raisers are using them—they do their work, easily and well.

The original Newtown Coal-burning Colony Brooder has been the big successful brooder from its introduction—it has been refined and perfected through many years of experience.

There is also an oil-burning Newtown, if you prefer it.

Madison Square Garden Show.

(Continued from page 308)

Trophy, which was awarded to the exhibitor winning first prize on young pen in the variety having the largest number of young pens entered, was won by Robadel Farm on their 1st young pen of White Orpingtons. This massive silver loving cup, designed on Grecian lines, was manufactured by Tiffany and Company, and is 12 inches high and weighs about 72 ounces. It was offered by the Garden show in memory of the late Henry V. Crawford, former mayor of Montclair, N. J., who was secretary of the Madison Square Garden poultry show for many years. Mr. Crawford died last February in Florida, where he was accustomed to spend the winter months.

The ancient and unique vase offered

by Naoyoshi Mori of Japan, to the exhibitor showing what the judges considered to be the best cock in the American class, was won by T. A. Havemeyer of New York City on his 1st prize White Wyandotte cock. Secretary Orr placed this special on a cock, rather than on a cockerel, believing that a really magnificent cock was the harder to get. This is the second time that Mr. Mori has offered a valuable special prize at New York. He is an enthusiastic fancier in Japan who admires American bred birds. Mr. Orr plans to purchase a trio of choice specimens and export them to Mr. Mori as a gift from the management of the Garden show.

Lord Dewar of England entered a number of birds, his entry comprising several different varieties. The difference between the English and Amer-

They Increase Profits—

CONKEY-NORWICH CHICK FEEDERS

THE thousands of users of these perfect chick feeders often express wonder at the marvelous results they give. The explanation is simple:—

Chicks are most susceptible to bowel disorders, which are due to intestinal germs. Droppings of one sick chick in food or water supply infect the whole brood and heavy loss is sure to follow.

Conkey-Norwich Chick Feeders *positively prevent all contamination* and the healthy chicks remain healthy—and grow.

For this single reason alone it will pay you to use Conkey-Norwich Chick Feeders. But consider additional advantages:—Large feeding space—no

crowding—no chicks hung or stuck in openings—no drowning in milk or water. Always clean to handle because chicks cannot roost on wire guard. Feed, water or milk always available, yet always protected and none wasted. Easy to fill and clean. Rain guard permits use on open range. Simple—practical—inexpensive—durable—made of heavy galvanized metal—highest quality workmanship.

Conkey-Norwich Chick Feeders are used and strongly recommended by such authorities as Prof. T. E. Quisenberry, Prof. Harry R. Lewis, Mr. U. R. Fishel, Pennsylvania Poultry Farms and a host of others.

Order a supply of these feeders *now*, have them ready when your first brood is hatched. An early-season test will show you how to grow more chicks this year. Get the Conkey-Norwich from your local dealer or order direct. See prices below. Descriptive circular mailed free on request.

winnings and egg records at laying contests have never been equalled by any other farm.

I have bred more contest pens of merit, produced more official 200-egg hens, than any other breeder.

I am the only breeder in the world who guarantees his stock to lay 200 eggs and more.

My Leghorns have been among the leaders at all contests the last six years. "Lady Storrs" still remains the highest Leghorn of 6,000 trap-nested at STORRS.

My customers have won 11 firsts; 6 seconds; 3 thirds, at laying contests over the world. Lately (1921) winnings 2nd, 3rd prizes in Wyandottes at N. Am. contest.

Reference—Every laying contest, poultry school and aeri. college in U. S., Canada or England.

PROOFS

1st prize—North Am. Contest, 1914;
1st prize—Mt. Grove contest, 1914;
1st prize—Storrs contest, 1914;
Highest Leghorn, Storrs, 1916;
Highest Leghorn Average, Storrs, 1916
1st prize—Essex, Mass., 1918;
1st prize—Essex, Mass., 1919.

Leading Leghorns, North American contest; Leading Leghorns, Storrs, contest, Conn.; Leading pen, Canada contest (with Reds) and 3rd place with Leghorns for 1920.

And many other prizes made by customers, which in confidence, I cannot mention.

NOTE—The 300-egg hen is unusual, still my eggs produced a 303-egg Leghorn for Rassmussen of Illinois; and a 302 egg hen for Delamaster, Elmyra, N. Y.

LINEBRED, PEDIGREE COCKERELS, TESTED COCKS, EGGS, CHICKS, STOCK, CONTEST PENS GUARANTEED TO WIN.

Leghorns 309 eggs; Wyandottes 312; S. C. Reds 289; Buff Rocks 272.

MAKE YOUR HENS LAY MORE EGGS

Every additional egg your hens lay increases your income. You can make them yield greater profit by giving them the grit that contains the vital substances needed in egg making—

PEARL GRIT

The Double Purpose Grit Contains lime, carbohydrates, sulphur and silicon. Helps in the making of white, hard shells and meaty eggs. Invaluable both as a bone and flesh builder. Send name of dealer and 10c for pound package prepaid—also booklet of remedies.

THE OHIO MARBLE CO.
Cleveland 81, Piqua, Ohio

ican ideals was very noticeable, as his birds stood cooped in their respective classes. His White Wyandotte cockerel, true to English ideals, had a firm but large comb. The bird was not as high in shoulders or cut away in breast as those we saw at the English shows in 1911. The type has been considerably Americanized, but it still falls short of what the best American breeders require. One breeder said that the bird looked like a Rose Comb Rhode Island White, but this is a rather severe criticism. In Buff Cochins the buff of the male was what we would term "red," while the female had vulture hocks. In Black Orpingtons we were much impressed by the pronounced depth of body in several of the birds. Such large size and great depth was remarkable, but the fluff was long and profuse; in fact, below the wing line the fluff rounded out like globes. In Black Hamburgs, the English bird was more on the Minorca order, with great earlobes that a silver dollar could not cover; heavy in comb, thick in shanks, and angular in body. The graceful lines of the beautiful American Hamburg were lost for size and lobe. Perhaps the most extreme development, however, was in the Black Minorcas shown by this Britisher. The cockerel's lobe was four and a half inches long, and as thick as a piece of beef steak. It was not only long and pendulous but actually heavy in weight. His body lacked the length of the American birds, and he was nothing much in size of body. The Black Minorca pullet's comb was five inches long and three and a half inches high, and her lobe was as big as a silver dollar. It is true that the lobes on many American Black Minorca pullets need more attention; they are altogether too small. But, in these English birds we have an example of the fancy running away from utility, with the result that the breeders do not produce a balanced type, and the refinements necessary in American birds are altogether lacking. The English Minorca cockerel, compared to the long, graceful bodied, fat breasted, strong legged 1st and 2nd prize American bred cockerels, looked like an oddity. He lacked balance and finish.

The Government exhibit, in charge of Harry Lamon of the U. S. Bureau of Animal Industry, Department of Agriculture, was an attraction. Here were Barred Plymouth Rock, Silver Hamburg, White Leghorn, White Wyandotte and Rhode Island Red specimens with 200 egg records. Every male in the exhibit was out of a female that had laid not less than 200 eggs in her pullet year. The birds combined Standard qualities. The White Wyandotte cockerels were just as typical of their breed as were the splendid White Leghorn males typical of good Leghorn quality. Several times during the week we heard breeders in the show refer to the combination of production values with Standard exhibition values in the birds of the Government exhibit. Mr. Lamon's breeding work on the Government farm is exerting a wide influence on the poultry business, and the purebred breeders on all hands are commending him on his able demonstra-

White Diarrhea?

Don't Let It Get a Start

White Diarrhea is a germ disease, causing irritation which brings on an inflamed condition of the intestines, resulting in a rapid breaking down of the tissues. Unless soon relieved, it will kill the chick.

Conkey's

White Diarrhea Remedy

tends to destroy the germs that cause the trouble and to allay the feverish condition prevailing throughout the intestinal tract.

Put It In the Drinking Water and the chickens do the rest. It is readily soluble and quickly reaches the seat of the trouble. Also use it as a preventive.

Have a Conkey Corner In Your Poultry House

And you will be ready for everything that requires immediate treatment. Conkey's Remedies and Tonics are guaranteed to do everything claimed for them.

Conkey's Lice Powder—for dusting hens, nests, growing chicks and for use wherever body lice exist.

Conkey's Lice Liquid will immediately rid your fowls and house of mites.

Insist on Conkey's. 25c, 50c and \$1.00 postpaid if your dealer can't supply you. Large Poultry Book sent for 6c in stamps.

tion of the practical value of American Standardbred poultry.

Be it understood that the New York show is a breeder's show. One visitor learned this to his sorrow when he stood in front of the magnificent class of White Leghorns, the like of which has not been in the Garden since the days of D. W. Young. This particular visitor passed sneering remarks on the futility of trying to get eggs out of a Standard exhibition White Leghorn female, and he proceeded to pass out cards advertising his own "utility" brand. A detective in Secretary Orr's employ put the man out of the show. The police service in the Garden poultry show costs \$500 for the week.

E. B. Thompson Not Showing

The weak spot in the show, compared to other years, was the class of Barred Plymouth Rocks. Do not misunderstand us; we say: compared to other years, the class this year was

Old friends at the Garden show. On the right, Frederick H. Stoneburn. Left, Frank L. Platt.

not as strong. If, however, we take the 1st prize cock at the Garden this year, the 1st cockerel, the 1st hen, and the 1st pullet, and compare these four birds with the four first winners at any other major show that has been held during the entire winter season, we must unhesitatingly say that the four birds in the Garden were the best of the year. But the Ringlets, as shown by the master breeder of the world, Edward B. Thompson, were not there. This was a big disappointment to many people. Robert J. Waldon, who won 2nd on pullet, said that while it was a pleasure to get a ribbon in the Garden, he would have rather gone down to defeat and had the privilege of seeing Thompson's birds. Of course, some of the Thompson blood was in the show. It is in evidence wherever there is a good chicken of the variety. The first pullet at the Garden this year was hatched from his eggs. She laid three eggs during four days of the Garden show. The 1st hen was shown by Wm. Hayner, who breeds the Ringlets. Why did not Thompson show? That question was repeatedly asked. Here are the facts. He has shown at the Garden each year for the past nine years. In the last four years he has won 133 prizes out of a possible 135. Three years ago he lost one 4th prize, and four years ago he lost a 5th. In the past two years he has won every prize and ribbon offered on Barred Plymouth Rocks, making a bull's eye each time and shutting out competition. Surely that was enough to demonstrate the value of his birds. He felt that there was nothing more that he could do. Moreover, the situation had reached the point where few breeders would show against him. Accordingly, he decided to stay out this

Electric Brooder Heater

Heat Your Brooder with Electricity

No dirt—no odor—never goes out and always at the same temperature. Just a turn of the switch and you have heat. Why go along with dangerous and unreliable kerosene or alcohol lamps in your home-made brooders when you can install electricity for less than cost of an old style brooders. All you need is a box and one of our heaters. Easily installed by two screws. Used on any socket, alternating or direct current, 110 volts for city use and 32 volts for the farmer.

HEATING ELEMENT GUARANTEED FOR ONE YEAR

Made in different sizes for 32 or 110 volts at the following prices, postpaid:
 60 watts for Brooder 14x14x10 inches, 12 to 36 chicks\$2.40
 100 watts for Brooder 20x20x10 inches, 36 to 72 chicks 2.75
 150 watts for Brooder 25x25x10 inches, 36 to 108 chicks 3.25
 To produce a high and a low heat the following are made for 2 heats in 1 unit:
 60 and 100 Watts.....\$4.00
 90 and 150 Watts..... 4.50
 Prices on request for larger Brooder Heaters. Write for literature and additional information.

Full awards in the classes are given in this report, together with open comment on the birds. It should be understood that this writer makes no pretense of rejudging the show. He simply tells of the birds as he sees them, for the benefit of those who could not attend, just as a judge and breeder who is a friend of yours would go to the Garden and, upon returning home, would tell you what he saw. We feel that the readers of this publication are our friends, and that they look to us to give them a fair review of the classes, commenting on the birds irrespective of ownership. So we write the comment in a blank book, without the aid of a marked catalogue, and unless the breeder advertises his name on his coop, we rarely stop to look up the catalogue to see who owns the bird. We try to be fair and look at a chicken with prejudice far removed. We cannot always agree with the judge, or always with the owner of the bird, but just as we grant to them the privilege of their opinions, we trust that they will grant to us the privilege of our opinion, although it may differ from theirs. It is gratification enough when a judge remarks, as one judge did at New York: "At last I agree with your system of reporting shows. It is elevating judging to a higher plane, by making the judges more careful, and the management of shows more appreciative of the good work of a capable judge. No one can today pull off a bonehead play with much hope of getting away with it."

And now, before we start the awards and comment, a final word on the

(Continued on page 383)

You

Get the Best When You Buy A Sol-Hot Canopy Brooder

If you could see all of the different makes of brooders in operation at one time, it would only take you a few minutes to decide which one to buy—you would quickly see WHY the Sol-Hot Brooder, heated with my new Super Sol-Hot Heater, with its positive, automatic oil feed—with a burner that can't overflow—with no wicks to trim—no smoke—no soot—no valves or adjustments of any kind, is the last word in brooders.

There is nothing on the market so practical, so efficient, so perfect and positive in its operation. You can go to bed at night with the absolute assurance that there isn't the slightest danger from fire—that your flame will be burning in the morning just the same as it was the night before and the temperature under the hover the same, too.

This is Going to Be a Great Year For Poultry Raisers with Sol-Hot Equipment

Aromas, Cal., January 21st, 1922
H. M. Sheer Company, Quincy, Ill.

Dear Mr. Sheer: It is a pleasure to see the way the brooder stoves are selling, and we must soon place another large order.

We have sold a party here five of your large brooders, although he has the agency for another make of brooder. He acknowledges the superiority of the Sol-Hot over the brooders he is handling.

Yours truly,
Dunbarton Poultry Farm
and Hatchery,
By E. A. Stainton.

If you can raise your chicks without the usual heavy mortality losses, due to improper brooder facilities, there is no reason why you won't have an unusually successful year. You can do it with a Sol-Hot Canopy Brooder. Sol-Hot Brooders are substantially made of heavy, galvanized, rust-proof material—nothing shoddy—nothing to wear out. Your chicks cannot get near the flame or scratch litter into it—a heavy metal screen extending from floor to top of canopy makes it absolutely safe—there is no danger of fire caused by burner overflowing—the automatic oil feed makes it impossible.

H. M. Sheer Co.,

Judging from conditions at the recent Poultry Show, we do not apprehend any serious competition from the cheaper oil brooders. There were three oil brooders on exhibition at the Poultry Show, including the Sol-Hot, and we are the only ones who made any sales.

The Super Sol-Hot won praise from all who examined it. We made four sales and got the cash, and in addition to the sales, we got many prospects.

We thought you would be interested in knowing what the situation is here.

Yours truly,
THE MOORE SEED CO.,
Philadelphia, Pa.

If he can't supply you—order from us

There is a Sol-Hot dealer in nearly every city and town, who will be glad to show you Sol-Hot Equipment, but if there is no Sol-Hot dealer near you, do not let that keep you from ordering. You can order direct from us with full assurance that your order will be shipped promptly and everything will reach you in perfect order. Sol-Hot Heaters are packed and shipped in one complete unit—all you have to do is to take it out of the box—fill oil container with oil and light the burner. Sol-Hot Canopy Brooders are also packed and shipped so that they are easily and quickly set up—practically no trouble—anyone can do it.

A size for every requirement

Following is sizes and prices of Sol-Hot Canopy Brooders. If your dealer cannot supply you order direct from us—we will make immediate shipment.

Standard Sol-Hot Brooder, with 32 in. Canopy (capacity 250 to 300 chicks. shipping wt. 32 lbs.).....\$17.50

Standard Sol-Hot Brooder, with 42 in. Canopy (capacity 500 chicks; shipping weight 38 lbs.).....\$20.00

Standard Sol-Hot Brooder, with 52 in. Canopy; (capacity 1000 chicks; shipping weight 45 lbs.).....\$22.50

Baby Sol-Hot Brooder, complete with Canopy (capacity 100 chicks; shipping weight, 21 lbs.) \$9.75

H. M. SHEER CO. Dept. A.P.J. Quincy, Ill.

supreme show that ends the season of noteworthy events.

The Madison Square Garden poultry show is held in a great city. Those who dwell there, with the works of man clustered close around, may find diversions and stimuli in the artificial attractions of the city, but when they attend the annual poultry show they find the true recreation and inspiration of nature in the attractive conformation and exquisite apparel of the living forms of domesticated bird life. That is the appeal of the chicken show to the masses of the city.

Let us enter. The aisles are crowded. The public is viewing the marvelous range of variations of form and size in the different breeds, and stopping in wonderment to view how nature deposits color pigments with such definite regularity in beautiful patterns with sober shades and vivid hues. Evening comes on. The aisles are congested. Ten times ten thousand candle power lights the great arena. The day is done for the breeder. He leaves the show to the interested spectators. He passes out by the front entrance. There, along the cold outside walls of the old building, are boys and young men who beg him for a pass. They have been thrown to the side by the tide of humanity that is surging into the poultry show, like skum that eddies on the back water. Poor unfortunates, far removed from the gardens of the earth, knowing little of the charm of living creatures clothed in wonderful plumage, yet enduring the cold and seeking with patience for admission. The breeder stops, unbuttons his overcoat, and hands a likely looking chap the only pass he has. He has done his part; he puts the thought out of his mind and walks on over to the hotel.

The breeders are now beginning to gather in the spacious parlor of the Prince George Hotel. George Peer is there. He is telling about the poultry show in Buffalo, in 1873, the year before the American Poultry Association was organized. E. B. Thompson and C. H. Welles draw up chairs. C. N. Myers and Henry Schwab come in. Across the lobby is a group of Leghorn men—the Schilling brothers, Rogers, Davey, McKean, Gloeckl, Bonfoey—discussing back and tail shape. They now join us. Then there is Cosh, and Rigg, and Ed. Hayes, and Walter Young, and Harry Lamon. The birds are in the show, but their imprints are vividly in the minds of these gentlemen as they speak, and their type and size and color, down to the finest details, are discussed as easily as if the very specimens were cooped before them. Much is said, but there is little argument. Each man is a master who speaks with authority. No one looks at his watch. Each has a love for learning, and the night is his to spend in the greatest poultry school in the world.

Let no young man think that New York is far away, and those who contribute of their genius to make the Garden the premier poultry show of the land, are men who have lost the common touch. New York is the show of opportunity. One young man after another has been "made" by the Garden show. Nowhere else is the

The Book of Poultry

*With 70 Full Color Plates and
Many Illustrations in the Text*

672 PAGES—CLOTH \$5.00

This great work shows all the leading breeds in true colors; 70 full pages of males and females in natural colors. Chapters on the origin, history, Standard requirements and mating of all breeds and varieties. Just the book for the purebred breeder. Special chapters on judging, exhibiting, condition, housing, feeding purebred poultry.

A work of art. Must be seen to be appreciated. This volume will prove to be a storehouse of knowledge to every purchaser. The color plates, by the famous artist, Magargee, were made especially for it, and could not be purchased separately for the price of the book. The text is

compiled from the authorities of all the world, and not hastily written to make a cheap book to sell. This book will prove a permanent volume in your library. Cloth binding; 672 pages; fine book paper. Price \$5.00.

American Poultry Journal, 523 Plymouth Court, Chicago, Illinois

This practical metal machine closely duplicates conditions of actual hen's nest. Nest is scientifically heated from above and around the eggs. Perfectly ventilated. An accurate, automatic regulator controls heat.

The Cycle Hatcher is less expensive to operate, and requires less care than the setting hen. Costs less than any machine of equal quality on the market.

Will not swell, crack or warp like a wood incubator.

Round glass window in top of hatcher enables operator to read thermometer without opening the machine.

The Cycle Hatcher being light in weight can be moved to almost any location. Requires but

little space. Hatches any number of eggs up to 50 on two or three quarts of oil. Two or more Cycle Hatchers with capacity of 50 eggs each produce more and better chicks than one large machine.

Let us send you a free booklet containing many suggestions about new methods of poultry keeping that will interest you by showing you how you can bring more chicks to maturity with less work, less time and greater profits.

This book also lists and describes many accessories for poultry raising, including Brooder-Hatchers, original Philo System Coops, Galvanized Iron Fireless Brooders, feed and water dishes, and scores of other items. Write for it TODAY.

ability of a breeder and the quality of his birds so quickly recognized. The men who know quality and whose opinions advance and remake standards are here. The young breeder who aspires to reach the top should be willing to sacrifice much to seek their company. Their criticisms are kindly and the vision of the young breeder is quickly and widely broadened.

The Garden show is a light—a revelation. In it you see a great purebred industry in the making. It is not finished. And, you, the last newcomer, may have your share to give. You shall have your share of triumph, too. The greatest glories lie in the future. Only a beginning has been made.

The thirty-third annual poultry exhibition in Madison Square Garden is over. It is not a show that has come and gone and now is dead. It has only slipped into history; for the Garden show makes history, and those who participate in it are those whose names are engraven in the records of achievement as breeders and improvers of one of the most important classes of domesticated live stock in the whole system of agriculture.

Side Lights on the Show

Turkeys and geese were cooped in the lower level. There were large classes of Bronze Turkeys, Toulouse geese; Pekin, Rouen and Mallard ducks. Roy Pardee, extensive duck grower of Long Island, took special interest in bringing out a large entry in waterfowls. We had an interesting visit with Mr. Pardee, being his guest one evening at the New York Athletic Club. The Long Island duck growers are building a splendid organization. They practically control their own product and are in better shape than the New Jersey egg producers. Mr. Pardee reports an enormous demand for baby ducks.

Bantams were cooped in the balconies. There were large entries of Rose Comb Black, Light Brahma, Buff and Black Cochins, Black Breasted Red and Birchen Game bantams.

The full text of the message transmitted by carrier pigeon from Madison Square to Beltsville, Md., thence by special courier on a motor-cycle to Mrs. Warren G. Harding at the White House, read as follows: "On the opening of our greatest of all poultry exhibitions—the Madison Square Poultry Show, the poultrymen of the country wish to extend greetings to you and your illustrious husband." The above message was signed by T. A. Havemeyer, President of the Garden show.

In the student judging contest, teams from the North Carolina State College, New York State College of Agriculture at Cornell University, the Connecticut State College, and the New Jersey College of Agriculture competed. The boys worked on four breeds, Barred Plymouth Rock hens, Rhode Island Red pullets, S. C. White Leghorn hens, and White Wyandotte pullets. Five specimens of each variety were provided for the contest judging. The students from North Carolina did best on the Wyandottes; the team from Cornell did best on the Reds; while the New Jersey boys did best on the Rocks and Leghorns, and won the silver cup.

The Buff Wyandotte Club held its annual meeting during the show. L. D. Howell, who judged the splendid class of Buff in the show, made the principal speech at the club meet. He said: "The class here this year is five years ahead of anything ever before cooped. There are no little Buff babies in the class. The birds have size. The secret of size lies in the egg. Breeders are setting a decent egg. The little egg is going into the frying pan. I believe that no one can get a good chicken from a little egg. My advice to every breeder is: If you have a

Don't Let Chicks Die in Shell

Send for This FREE Book and Know How To Prevent Loss

YOU may wonder why your chicks die in the shell—why you have poor hatches—why you have all sorts of trouble raising baby chicks. Prof. T. E. Quisenberry, one of the World's Most Practical Poultry Authorities, has written a book entitled "Dollars and Sense in the Poultry Business", which outlines methods that have brought supreme poultry success to more than 40,000 men and women in all parts of the country.

96 Pages of Practical Methods

The author of this book is the Founder and Dean of the Faculty of the American Poultry School—an Institution which has the endorsement of Poultry Authorities throughout the World. People everywhere—in cities and suburbs, in small towns and on general farms, have turned failure into success by following Prof. Quisenberry's simple methods.

Harry R. Lewis, the well-known Poultry Authority and Author of widely read poultry articles is a co-worker of Prof. Quisenberry and is V-Pres. of the American Poultry School. This book embodies many of Prof. Lewis' valuable suggestions.

Everything About S. C. WHITE LEGHORNS

Remarkable Book FREE

Remarkable New Book, just off the press, "Everything About S. C. White Leghorns," by A. F. Rolf, Secretary National S. C. W. Leghorn Club, sent free to everybody who mails coupon below. Book tells everything you want to know about S. C. W. Leghorns. 23 subjects, thoroughly discussed. Some are:—

- How to Mate and Breed White Leghorns
- How to Judge White Leghorns.
- How to Condition S. C. White Leghorns for the Show
- How to Wash White Birds
- What and How to Feed Leghorns.
- How to Prepare a Balanced Ration for Leghorns.
- How to Produce a Strain of Heavy Layers.
- How to Increase Egg Production Through the Use of Artificial Light.
- How to Obtain Highest Prices for Leghorn Eggs.
- A Good Dry Mash Formula.
- How to Care for Baby Chicks.
- Home-made Rations for Baby Chicks.
- How to Obtain Best Results Under Farm Conditions.
- How, When and Where to Advertise.

Special Subjects On Poultry Diseases

Special subjects on How to Prevent and Cure Bumble Foot, How to Combat Lice and Mites, How to Treat Diseases of Leghorns. This information worth \$10.00 to anybody.

female, no matter how good she is in type and color, if she is a little thing, cut off her head. You have in this show today type and size and color. I put color last because we not only have it, but have had it."

The Buff Wyandotte Club had a booth in the show, and the club was active in promoting the interests of the variety. Breeders are waking up to the fact that all the breeds and varieties are in competition with one another. They are realizing as never before that they must not only produce a well balanced fowl, but must do something to develop general interest in that fowl.

C. D. Cleveland related a new experience with intestinal worms. The worm appears to bore through the intestine. He stated that his losses and those of F. B. Williams had been quite an item. He said that the solution seems to be to worm the birds with a good vermifuge once a month.

M. L. Chapman remarked that he had won five firsts at the show. He said: "If I were a specialty breeder, with only one variety, five firsts would be a tremendous win, and all the birds I have here, cooped together, would make a tremendous impression. Moreover, it would be easier, as a specialist, to win five firsts in one variety than it is for me to win an equal number of prizes in three or four varieties."

Rufus Delafield stated that a beautiful silver cup had been offered on "production classes" at the recent Newark show, but the commercial egg farmers did not take much interest in competing for it. He believes that the shows of the future, as in the past, must look to the breeders of Standard exhibition poultry.

Geo. Peer told of more than forty years ago when what are now Silver Wyandottes were first shown as Sebright Cochins. The show was judged by score card. There was a pen of Sebright Cochins. One exhibitor said the judge could not score those birds twice alike. Another exhibitor said he could. The judge was told that the cards were missing and that he would have to score the pen again. He protested, but at last scored the pen again. The scores were quite different in the second instance than they were originally. The judge was indignant. He said that "the light was different." Wonder if anything like this happened the past season? Times haven't changed much, except that all big shows today are judged by the comparison system, and there is less score carding than there used to be.

Harry G. Forster is starting a Capon farm in New Jersey. He believes that the production of good poultry meat is a line of poultry operations that is so neglected that it offers the biggest opportunities.

Harry Darlington had a new office. Those who have seen the machinery of the Garden show in motion know the valuable part taken by Mr. Darlington. He has been handling the detail of the big organization since the days of Secretary Crawford.

The old office of Henry V. Crawford is now the exhibitors' room. It was here that J. H. Drevenstedt and Barney Mosher spent a happy afternoon in reflection of Garden shows that have made history.

We had a long visit with Mr. Drevenstedt and John Kriner. Their enthusiasm for a good bird never cools. These keen fanciers never get too tired to hunt up a good bird and look it over. In judging Black Langshans and Black Minorcas they had heavy classes of supreme quality.

W. B. Atherton, secretary of the great Boston show, spent a couple days at the Garden.

All through the week, E. B. Thompson never spoke a critical word about the Barred Rocks at the Garden. When breeders and visitors expressed their keen regret at not having seen his Ringlets, he replied with earnestness and in a kindly way: "My birds have won all the glory possible." To one who wanted more detail of what his birds had done, he set forth the facts as follows:

LEE'S LICE KILLER

Kills lice, mites, bed bugs, etc., affecting poultry. Spray or paint on roosts, etc. Gets body lice on chickens, too. Works while they sleep. No dusting, dipping, greasing or banding. Saves lot of unpleasant work. At most towns, at stores handling Lee Poultry Supplies. Write for information and Free Book.

Geo. H. Lee Co., Dept. P-1, OMAHA, NEBR.

"At the five shows, 1917, 1918, 1919, 1920 and 1921, they won every first prize offered—27 out of 27. At the four shows, 1918, 1919, 1920 and 1921, they won 133 prizes out of a possible 135. At the 1920 and 1921 shows, our last exhibits at the Garden, they won every prize and ribbon offered in every class, namely: 1st to 5th on cocks, cockerels, hens, pullets, old pens and young pens—60 prizes out of 60—at both shows. Every prize and ribbon offered in every class has been won two years in succession by my Imperial Ringlets—1920 and 1921—including sweepstakes champion male and female, and shape and color special, male and female, and every special prize."

Wm. Hobbs won 1st Buff Orpington cockerel for the ninth successive year. It used to be that the Orpington men had chicks peeping at the time of the Garden show. One thing certain, the finish on the cockerels, with length of saddles and massive bodies, are not obtainable on "springers."

Sportsmanship

We want to make mention of the fine sportsmanship that has characterized the Englishmen who have gone to the great expense of putting down teams of birds in Madison Square Garden. Among those who have come across in the past decade are Wm. Bell, Miss Carey, Rev. E. Lewis Jones, Wm. Cook, Capt. Max De Bathe, Alfred Birch, and now this year Lord Dewar entered birds in a number of classes. In our report of the Garden show, we do not enthuse over the ideals of the English fancy, but we do enthuse over the sportsmanship of the English fanciers. When Walter Bradley cabled from New York to Lord Dewar, what their birds had won at the Garden show, Lord Dewar, inspired by the noble sentiments of the English people, put on the long rope that runs under the Atlantic Ocean, the following message:

"London, Jan. 26, 1922.

"Bradley,
"c.o. Secretary, Poultry Show,
"Madison Square Garden.

"Sincere congratulations. I told you would get every opportunity to make good from the generous, big hearted, fair dealing American sportsmen.—Dewar."

A. D. Smith, secretary of the Illinois State Show, and founder of the Illinois Egg Laying Contest at Quincy, was an interested visitor at New York, going on to Beltsville, Md., to see the poultry plant of the U. S. Department of Agriculture. Mr. Smith expressed profound admiration for the high type of birds shown at the Garden, and emphatically stated that the Illinois egg competition would continue to be a proving ground for standard bred birds.

The entry of Wyandottes was large and meritorious, and especially worthy of mention, and the beautiful Silvers have hit a new pace. Buffs show the hands of thoughtful breeders, and set a new mile post on the road of progress. Whites combined the wonderful qualities of the true Wyandotte, and the day of the faddist is gone. Columbians have the correct size and type of the marvelous Wyandotte breed, and carry the well developed plumage markings of the magnificent Light Brahma. Surely the future is bright for such well formed and beautifully plumaged fowls as graced the pens of the Silver, White Buff and Columbian Wyandotte varieties at New York.

New York has probably again carried out its thirty-year-old record as the show hall that will start females to laying. It has become a sort of tradition that a week in the Garden will start a hen or pullet to laying. Is it not because females that go to the Garden Show are necessarily in the pink of health and about ready to commence production? And, then throughout the week of the Garden show, the birds receive the best care that the greatest fanciers of the country can give them. Men like John Kriner, who supervise the feeding during the show, could put bloom on any bird and keep it fit. Hewes wants Kriner to come to Chicago, Dec., 1922. But Baltimore has a prior claim.

Trapnested Pedigreed ENGLISH LEGHORNS

Trapnested and linebred six years on our farm. Every nest on our farm is a trapnest. Every chick hatched on our farm is a pedigreed chick. Hundreds of pullets are trapnested here every year. We have mated this year 270 choice breeding hens with trapnested records from 180 to 281 eggs in one year, from which we offer hatching eggs of strong vitality. All breeding stock on open grassy range. Write today for free illustrated mating list, describing our farm and trapnested flock of bred-to-lay White Leghorns. Address BUCKEYE LEGHORN FARM, R. D. 21, AKRON, OHIO.

Laid 281 eggs in 1 year

Awards and Comments

Barred Plymouth Rocks—Frank Pevall, Winsted, Conn., 3 cock. Bradley Bros., Lee, Mass., 1-2-4-5 cock, 1-2-3-5 ckl. Wm. Hayner, Livingston, N. Y., 1-2 hen. M. B. Hickson, Lynchburg, Va., 4 ckl, 1 pl. Frank P. Seaman, Mineola, N. Y., 4 pl. Robt. J. Walden, Middleburg, Md., 2-5 pl. Wm. P. Stinernagel, Westfield, N. J., 3 pl. T. H. Hazlett, Newburgh, N. Y., 1 young pen. Elmo Brown, White Plains, N. Y., 2 young pen.

Small class; Thompson not showing. First cock, one of best birds of year. Better finish than common. Could stand little more station. Breast feather small and narrow; broad feather would improve breast, giving more ringlet effect to stripes. Good under barring. Second, not as uniform sheet of color. Third, split tail, poorly furnished. Was 1st at Boston. Fourth, legs set far back; some metallic. First hen, big well bodied, uniformly barred all over; clean white bar; straight bars; nice broad feather. Second, tone darker; good size; fails in type. First cockerel, well grown, good type, well finished tail; nice clear color; better breast than cock; straightest barred cockerel in class. Second, short in tail; pretty good blue tone of color. Third, bigger; good station and back; not as straight barred as winner; well finished. Fourth, another well built cockerel; some metallic on tail; younger; chick wing bow; color matches in different sections pretty well. Fifth, big fellow, poor finish. Not the uniformity that one use to see when Thompson put down a full string. Several of the best cockerels in the class with broad backs, development, furnish, and straight barring, shown by Newton Cash, judge, but not in competition.

First pullet shows good breeding and has good development; one of largest, best bodied pullets seen this year. Straight barring, with clean white bar; narrow barring on wing bow and wider on back; not the consistency of the same kind of barring that made New York the premier show of the Barred Rock world. This pullet evidently laying and past her best for exhibition. Second pullet, gray neck; different kinds of barring between back and breast. Third, smoky under color. Fourth, gray neck on a dark back. Fifth, another chicken that would win in almost any show, but a comedown for New York, where one used to see 1st to 5th pullets good enough so first four could be taken out and 5th would still baffle a man to find words to describe her quality. Such chickens have made us critical.

White Plymouth Rocks—A. H. Harris, East Pepperell, Mass., 1 cock. Frank H. Davey, Yonkers, N. Y., 4 cock, 1 hen, 4 ckl, 1 pl., 3-5 old pen, 2 young pen. J. D. Koons, Allentown, Pa., 2 cock, 4 pl. Wilburtha Poultry Farm, Trenton Jct., N. J., 3-5 cock, 4 hen, 2-5 ckl, 2 pl., 1-4 old pen, 1-3 young pen, L. C. Bontoe, Deep River, Conn., 2-3-5 hen, 3 ckl, 3-5 pl., 2 old pen, 4 young pen. W. G. Silliman, Bay Shore, N. Y., 1 ckl. Chas. Schmalig, Port Chester, N. Y., 5 young pen.

First cock, a bird of good substance; stands wide on bright yellow shanks; ideal head; correct back and balance of body. Wins championship. Pure Davey bird. Second, long in body; fails to winner in comb, also spread and color of legs; poor wash on tail. Third cock a beautiful specimen; well covered tail with smooth sickles and lesser coverts; here is a good one that fills the eye; nice top finish. Fourth, good cock; lacks finish. First hen, big without coarseness; a smooth feathered, well proportioned hen. Second, round shoulders; nice profile, but lacks substance of winner. Third, another smooth female. Fourth, an excellent female. Fifth, another good one; has slight tendency to cushion. First cockerel, strange surprise; cut away in breast, poor tail. Second, well turned out chicken; well finished like 3rd cock. Third, another splendid cockerel; well balanced, good body, like 1st cock. Beautiful saddle. Fourth, more comb, but strong head, and judge awarded him special for best head. One of the best cockerels seen this year. First pullet, shade long in beak; one of the most model females ever shown. Second, on same order; trifle smaller head. For type and smoothness of feather 1st and 2nd pullets a wonderful pair. Third, rougher in feather. Fourth, big, long, smooth pullet.

Silver Penciled Plymouth Rocks—Geo. E. Greenwood, Lake Mills, Wis., 2 cock, 1 hen, 1 ckl, 1 pl. Henry L. Wilbur, Tiverton, R. I., 1 cock, 2 hen, 2-3-4 ckl, 2 pl., 1 old pen.

Magnificent exhibit. First cock, good size, silvery white ground color, sound black parts. Second, good cock. First cockerel, well marked, good Rock type; well finished. Well striped; sound under color. The best seen in

After Three Weeks in a
Farmer's Favorite

WHICH

**Don't Hatch Your Chicks
to Die in Hot Air Brooders**
Your profit dies with the chicks.
Dead chicks mean loss of profit
that could have been made—to
say nothing of time and money
spent in hatching them.

After Three Weeks Brood-
ing by Hot Air

THE FARMER'S AVORITE BROODER

Broods exactly like the mother hen, by contact heat, no hot air for the chicks to inhale. The hen don't brood by hot air. The contact heat is supplied by storm proof cold blast Deitz Lantern, exposed to the outside air, and can be seen burning from a long distance, can't overheat or blow out. Lantern can be refilled and lighted in your home and replaced in wind or storm. This Brooder is winning the confidence of hundreds of poultry raisers throughout the country. Don't be fooled. Which kind of chicks do you want: A full brooder of Nature System Farmers' Favorite chicks or a few mummified remnants of the Hot Air Treatment?

You will notice this picture shows the thermometer and thermostat entirely enclosed inside the warming body, not outside where the chicks breathe. This is the reason that our Famous Farmers' Favorite Brooder is the only one in the world that requires a system of temperature reading exactly like the body of a living hen, which is 103 to 104 degrees. This will warm up one or one hundred chicks quickly in nature's way. There is no circulation of hot air in the chick hover; here the temperature is only a little higher than in the open air. Does this not positively prove to you that we have invented in mechanical form, principles which are exact duplicates of nature?

If you want to raise your chicks into strong, vigorous maturity you need the Farmer's Favorite—the best, simplest, and most durable brooder in the world. Write for catalogue folder.

GLENDSIDE, Montgomery County, PENNSYLVANIA

Wipe Out Every Rat and Mouse

Amazing New Discovery Quickly Gets Every One. Not a Poison.

Don't be satisfied with trapping or poisoning just a few. Exterminate the whole bunch—old, young, big and little. Rats do millions of dollars' damage each year. They kill chickens, destroy grain, damage buildings, merchandise, and are filthy disease carriers.

A wonderful new scientific discovery called Imperial Virus now enables you to clear your place of every rat on it. The amazing feature of it is that it is not a poison and affects rodents such as Rats, Mice, Gophers, etc., only. It is perfectly harmless to humans, stock, poultry, pets. It can, therefore, be spread anywhere knowing it will kill only the pests you want to get. One rat affects the others and in a short time the whole colony is exterminated, root and branch. They die outside, too, hunting air and water.

GET YOURS FREE

The manufacturers of this amazing Virus, to get it quickly established and widely used, are making a Special Guaranteed Introductory Offer of two regular, big, full sized (double strength) \$1.00 bottles, for the price of one. Use one yourself and sell the other to a neighbor, thus getting yours free. They will also tell you how you can make money telling your friends about it. As this offer may not appear again, you should act at once or clip for future reference.

You need send no money; just your name and address to the Imperial Laboratories, Room 253, 2110 Grand Ave., Kansas City, Mo., and pay the postman \$1.00 and a few cents postage, when the two bottles arrive. It costs you nothing if it does not do the work, as they positively guarantee to refund your \$1.00 any time after 30 days if you are not satisfied.

Shoemaker's Poultry Book and Almanac for 1922

Send for it NOW!

The book has about 200 pages, with many colored plates of fowls true to life. Tells all about chickens, their cost, their care, and diseases and remedies.

The Globe

C. C. SHOEMAKER, Box 605, FREEPORT, ILL

It also tells all about Incubators, their prices and operation. All about poultry houses and how to build them. It's an encyclopedia of chickdom. You need it. Only 20 cents. Your money back if not satisfied.

some years. Second, lacks striping. Third, has some white flecking. First pullet, best of the females; steel gray color, nicely marked. Partridge Plymouth Rocks—O. H. Hostetter, Hanover, Pa. 3 cock, 2 hen, 4 pl., 2 young pen. Bird Bros., Meyersdale, Pa., 1-2-4 cock, 1-3-5 hen, 1-2-3-4-5 ckl., 1-2-3-5 pl., 1 old pen, 1 young pen. Henry Katzen, Sykesville, Pa., 4 hen.

First cock, magnificent top finish and top color. One harmonious shade of rich red; wonderful saddle striping; some red in lower breast. Second, more of an orange tone in ground color. First hen, splendid Rock type, well penciled fluff and body. Second fails to winner in type, being more chunky; rich ground color. Third, another well penciled female. Bird Bros. are breeding a clean, narrow black penciling; not heavy black bands of old. First cockerel, darker on wing bows than on saddle or neck. Second, well built bird; similar in color to winner. First cock stands as a model for this variety. First pullet, good Rock type, rich ground color; splendid penciling. Second, close runner up.

Buff Plymouth Rocks—John Schofield, Firthcliffe, N. Y., 4 cock, Galvin Farm, Elmhurst, N. Y., 5 cock, 2 young pen. Boys and Girls Poultry Club, West Raleigh, N. Car., 2 cock. B. N. Duclos, Lenox, Mass., 3 cock, 1-3 hen, 1 ckl., 2 pl. Kingman Farm, Randolph, Mass., 1 cock, 1 old pen. Edward E. Minard, Lorain, Ohio, 2 hen, 3-4 ckl. James H. Vincent, Hazleton, Pa., 4-5 hen, 5 ckl., 1-5 pl. J. A. LeGore, LeGore, Md., 2 ckl. Fred Armer, Ballston Spa, N. Y., 4 pl. Andrew Riddell, Delmar, N. Y., 3 pl. Kerlin Farm, Pottstown, Pa., 1 young pen.

First cock, well built, level sheet of color; tone lighter than golden buff. Second, big, long, nice colored bird; legs set too far to rear. First hen, good type, smoother feather; level, soft color; a remarkable female. Second, another good hen; big; needs more tail. Third, lighter color. First cockerel, nice color; poor blade on comb; short tail. Second, nice color; needs more breast and tail. Third, big fellow; good body color; fails to carry sheet of color out over tail. Fourth, younger; nice one. Fifth, shy in breast; shade darker on tail. First pullet, good type and smooth color; clear wings and tail. Second, nice buff; legs too far back, throwing body out of balance. Third, more on Wyandotte type. Fourth, narrow body. Fifth, strong head, good substance of body; evidently laying and a bit past as a show pullet.

Columbia Plymouth Rocks—Fred W. Ott, Hoopole, Ill., 1 cock. Miss E. O. Hincken, Brooklyn, N. Y., 2 cock. Henry L. Wilbur, Tiverton, R. I., 3-4-5 cock, 1-2-3 hen, 1-2-3-4-5 ckl., 2-5 pl., 1-2 old pen, 2 young men. J. M. Jones, Hornerstown, N. J., 4-5 hen, 4 pl. Edw. W. Westphal, 3 pl. Duffield Farm, Little Compton, R. I., 1 pl., 3 old pen, 1-4 young pen. N. B. Hartman, 6 E. 39th St., New York City, 3 young pen. T. J. Enslin, Hackettstown, N. J., 5 young pen.

Best class of year, out topping Chicago National. Clean color in cocks; no brassy or smutty birds in the row. First, fresh, clean colored bird, with good hackle. Second, fails to winner in condition of shanks. Third, best saddle in class; regular Light Brahma, with a small, neat, open stripe. Fourth, another bird of good substance. Fifth, heavy black lacing. First hen, a beauty, type of a White Rock with the neck of a Brahma; clean back and body. Second, close runner-up; lower set. Third, beautiful tail lacing; narrower feather in neck than first; well laced neck; clear surfaced white back and body; light shank. First cockerel, unusual green sheen in neck and tail; lifts up the black which would otherwise be flat. An important point in the Brahma, upon which Col. Rock men are to be congratulated for transplanting to their class. Second, big, well grown Rock, fails in hackle to winner. Third, smaller; shows trace of straw color. First pullet, big, long body, trace of black flecking in back; fair neck and tail. Second, few more black ticks in back; nice neck. Third, nice color; lacks bone; pale lobes. Fourth, strong headed, good bodied bird.

Silver Wyandottes—W. E. Samson, Kirkwood, N. Y., 4 cock. Frank H. Davey, Yonkers, N. Y., 3-5 cock, 1-3 hen, 2-3 pl., 1 young pen. Irvin J. Matlock, Haddonfield, N. J., 2 cock. Dr. T. H. Charnbury, Hanover, Pa., 1 cock, 2 hen, 1-4 ckl., 1-5 pl. Frank Van Alstyne, Castleton, N. Y., 2 ckl. Miss Viola Kiker, Polkton, N. C., 3-5 ckl. James F. Hughes, Peekskill, N. Y., 4 pl.

First cock, big, well built fellow; well laced breast; clean top color. Secondaries completely laced around like a Sebright. Second, similar wing bay; excellent type; smaller feather in breast with frosting. Third, straw color on wing bow. Well laced breast. First hen, beautifully laced, with same kind of lacing on breast as on wing bows and back, making her consistently laced all over. Sec-

have been recognized as the highest examples of purity and quality. Winners at New York, Chicago and Boston. Send for mating list.

Wm. Ellery Bright
OWNER

Box A Waltham, Mass.

Kills Hatching

Many fanciers now use Egg-O-Latum, the great egg preserver, on all eggs for the market. It not only keeps them fresh but prevents hatching, thus protecting against the pirates who watch to obtain high grade hatching stock at market prices. Rub on—wipe off—does not show—Eggs will never hatch but keep fresh longer.

Egg-O-Latum is a soft, white, cerate wax odorless, tasteless, harmless. Applied by simply coating palms of the hands, then rubbing on eggs, a dozen a minute. Keeps eggs fresh one year. A 50c jar enough for 50 dozen eggs, \$1 jar for 200 dozen. If no dealer, order by card. Postman will collect. No extra charge. Handy as 'phoning.

GEO. H. LEE CO. Dept. P-2 Omaha, Neb.

Young's DRY FRONT Poultry House

Write for 1922 Booklet

Note the features of the overhang roof, absolutely rain proof; also, ventilator above the swinging window. The above is the type that Prof. Harry R. Lewis, head of the Vineland Egg Laying Contest, is equipping his new farm with, at Davisville, Rhode Island. Made in all sizes. Write for free booklet showing forty different cuts.

E. C. YOUNG CO., 6 Depot St., Randolph, Mass.

DANDY BONE CUTTER

Feeding green bone is one of the first steps to gain a big egg yield. But the bone must be cut right. The Dandy cuts across the grain of the bone, enabling the hen to digest the nutritive elements better and convert same into eggs, blood and feathers. No money in advance. 15 days' free trial. Big reduction in prices. Write for free booklet, and FREE BRED BABY CHICKS. This practical book worth dollars mailed for 10 cents. Erie, Pa.

ond, lacing on throat fails to go clear around feather; considerable very round lacing on top of this bird; rarely see more perfect freedom from pear shaped lacing. Third, large feather and open lacing. First cockerel, good Wyandotte type; little rust on saddle; well laced breast, and wing coverts which form the wing bar, and well laced secondaries which form the wing bay. Second, lacks substance of winner; smaller feather in breast, with some frosting; nice head and strong wing bar. Third, dark shawl on lower hackle; unusually nice open diamond shaped striping in saddle. First pullet, good type; nicely laced all over, dark in lower hackle. Second, a longer, narrower feather in back, producing a different kind of lacing on back than is carried on breast. Third, lacks breadth; little high in tail; same back and breast color as second. Fourth pullet, small, narrow feather, producing small lacing with narrow center. Fifth, frosty on the back. Small size; nice open lacing.

Golden Wyandottes—E. C. Belton, Mt. Airy, N. C., 2 cock, 2 ckl., 1 pl. W. V. Moot, Huntington, N. Y., 3-4 cock, 2 hen, 4 ckl., 5 pl., 1 young pen. Geo. W. H. Soelner, Washington, D. C., 1 cock, 1 hen, 3-4 pl. Frank P. Seaman, Mineola, N. Y., 1-5 ckl., 2 pl. H. O. Emmons, Chelsea, Mass., 3 ckl.

First cock, rich, level colored fellow; nicely laced breast and fluff. Second, good type and same rich color. Third, lighter in neck, not as well laced in breast. First, nice hen. Second, not as sound black edging in lace. First cockerel, best bird of the year; wonderful back and saddle lacing; fine breast and fluff; rich, level ground color all over. Second, fails to winner in type; sharp angle where tail joins back. Third, lighter ground color in neck hackle. First pullet, rich ground color; objectionable in V-shaped lace in back. Second, somewhat rounder laced bird. Best pullet in class unplaced; understand she caught cold in shipping and was out of condition at time of judging. Third pullet, large comb. Fourth, frosty breast. All exhibitors here seem to be agreed on richer ground color, and class represents this ideal of color.

White Wyandottes—T. A. Havemeyer, Mahwah, N. J., 1 cock, 4 hen, 1-2-5 ckl., 2 pl., 2 old pen. F. B. Williams, Naugatuck, Conn., 2-3-5 cock, 3-5 hen, 3-4 ckl., 1-5 pl., 1-4 old pen, 1-3 young pen. Mrs. A. H. Faber, Kitchener, Can., 4 cock. Chas. Nixon, Washington, N. J., 1 hen, 3 pl., 3 old pen, 2-4 young pen. Frank H. Davey, 2 hen, 5 old pen. A. W. Hewitt, Windsor, Conn., 4 pl. Evergreen Poultry Farm, Leighton, Pa., 5 young pen.

First cock, well put down bird of good size, good type body; trifle tight in tail; always in good shape. Second, another well put down cock; tail little further along and carried up better than winner. Third crooked center toes; another well finished bird; trifle high in middle of comb. Fourth, larger feather; poorly finished tail; cobby body. Fifth, beautifully bodied cock; well spread tail, eyes deep set with heavy skull. First hen, good head, neck, back, tail, with wings laying smoothly against sides of body. Nice breast. A hard hen to beat. Not a short coupled up bird. Second, beautifully headed hen, trifle shorter than winner; another fine female. Third, wings lay a little tighter into the body. Fourth, nice lines, more on order of first, but heavier in fluff than first, second or third. Fifth, a short hen, similar to third. First cockerel, nice head, good top and underlines; nice length of back, with wide spread, well covered tail, smooth plumaged bird. Second, shorter backed bird. Third, a bird that carries his width clear to the end of his tail; a well finished, nicely put down fellow. Fourth, waves in little over sides of saddle; tail not as well covered with coverts as others ahead. Fifth, a beautifully put down cockerel; well grown and fully finished; trifle tight in tail. First pullet, good sensible bird; has smooth lines; nice head; a rare specimen. Second, wings cut badly into cushion. Third, nice pullet; smooth sides; correct back line; not short, yet as deep as she is long; not as hard webbing in feather as first. Fourth, short and loose in feather. Fifth, smaller than winners; about standard size; pretty good outline but not much width.

Black Wyandotte—Bradley Cook, Aley, Pa., 5 cock, 3 ckl. Ray D. Brown, Vienna, Va., 3 cock, 1-4-5 hen, 3 pl., 1 old pen. R. E. Hickman, Girdletree, Md., 2 cock, 4 ckl. C. H. Nesbitt, Riverhead, N. Y., 4 cock, 1-2-5 ckl., 1-2-4 pl. Mrs. F. L. Mentz, Maple Shade, N. J., 1 cock, 3 hen. Lord Dewar, East Grinstead, Sussex, England, 2 hen, 5 pl.

Big class, with some nice quality showing. Color of shanks do not seem to matter much, first cock having dark shanks and first cockerel yellow shanks. The cockerel is a black surfaced chicken with white under color in all sections. No one could object to black pin feathers in his carcass. Why insist on black under color, sacrificing yellow shanks

HOW TO RAISE
90% OF YOUR
BABY CHICKS

Two Baskets Of Eggs.

From the same amount of feed and the same flock of hens, you may just as well have two baskets of eggs instead of one. How? Well, not by the use of cheap stimulating tonics. Stimulants always react. The use of Nova-Dex is safe and certain, and there is no reaction. Nova-Dex is a pharmaceutical preparation that immediately corrects internal irritation most poultry is subject to which retards healthy functioning of the laying organs.

The effect of using Nova-Dex is prompt laying, increased production and laying over a longer period. Eggs are more fertile. A conditioner for chicks, aids digestion and prevents gapes, diarrhea, roup and intestinal worms. Keeps them strong, healthy and vigorous. Nova-Dex is sold on an absolute guarantee. Purchaser will be satisfied or money back. Let us send you a package sufficient for 50 hens, a month's trial for \$1.00 postpaid. Order today. Agents wanted.

NOVA-DEX LABORATORIES, P. O. Box 1459-AC Cincinnati, Ohio.

and causing the breeder to double mate? First cockerel can be counted on to breed good pullets. Some attractive quality in pullets, with first and third having Wyandotte type and greenish black sheen to plumage.

Buff Wyandottes—G. Arthur Cook, East Hampton, Mass., 1-3 cock, 2-3 hen, 2-3-4-5 chl., 1-2 pl., 2-3 old pen, 1-2 young pen. W. S. Crandall, Elmsmere, N. Y., 2-4 cock, 5 hen, 1 chl., 3-5 pl., 1-5 old pen, 3-4-5 young pen. Matthew Boyd, Cuyahoga Falls, Ohio, 5 cock, Frank Ritchie, Patchogue, N. Y., 1 hen. Stuart A. Howland, Granville, N. Y., 4 hen. Percy B. Hall, Dudley, Mass., 4 pl. F. W. Spalding, Pountney, Vt., 4 old pen.

The best class ever put down. First cock has size, type and a uniform sheet of lustre in buff; clear tail. Second, fails to winner in finish of tail and fullness of breast. Third, trifle heavy in comb; tail covering a shade darker than back. Fourth, a good Wyandotte, broad, nice top color; breast a shade lighter, making two-color bird. First hen, good type, level buff color that runs down to the skin. Second, smoother web of feather; smoother feather; level, lustrous color; better shape of tail; fails in small, narrow comb. Third, big hen; clear wings and tail; loses in uniformity of color to other two. Fourth, trim hen, large, smooth feather. Fifth, another smooth colored female. First cockerel, nice type; rick, lustrous buff; tail needs little more covering. Second, beautiful cockerel; smoother feather; level, lustrous color; broad tail coverts with tail nicely covered; needs trifle more depth to breast. Third, a close runner-up. Fourth, big; beautiful color; needs trifle more filling in front of tail. Fifth, big, soft, tone of color; trifle more station than others. A remarkable string of cockerels. Little rolly-polly fellows out of it. First pullet, smooth sides, well spread tail, nice head, good color. Second pullet on same order; almost shy spike on comb. Such birds are the product of a student. Type that would not be out of place in White Wyandotte class. Third, bright faced pullet; narrows in tail a little; clear wings and tail, of course. Fourth, again good type, smooth feather, soft color. Fifth, long legs, probably young.

Partridge Wyandottes—Buck Bros., Oxford, Mass., 3-5 cock, 2-5 hen, 1-3 chl., 2-3 pl. Roy C. Lester, Darien, Conn., 4 cock, 1 hen, 2 chl. Sheffield Farm, Glendale, Ohio, 2 cock, 3-4 hen, 4-5 chl., 1-4 pl., 1 old pen, 1 young pen. H. J. Hunt, Washington, D. C., 1 cock. F. W. Guild, Holliston, Mass., 5 pl.

First cock, rich red fellow; low in tail; nicely striped saddle. Wyandotte shape is not made up of a broad back and a short, low tail. Look at the picture in the standard and read the angle of tail carriage. In looking at Wyandotte males, we see too much of a tendency to get a broad, cobby bird with a short, low tail. Second, fails to winner in comb only; beautiful, long saddle, nicely striped; well furnished tail; sound black breast; a brighter shade of red than winner. First hen, flat head; a cobby hen, nice penciling. Do not agree with judge on first cock and first hen. Would prefer second cock and either second or third hen. Second, larger hen; rich, brownish red ground color; well penciled; good Wyandotte type. Third, another big hen, rich ground color, nicest lines of penciling in class. First, second, third cockerels, bright red ground color, nicely striped; good size. Both first and second have good carriage and finish. First not a short backed bird. First pullet, good size and type, strongly penciled all over. Second, orange neck, darker shanks. Third, pencils are heavy.

Columbian Wyandottes—Wilkinson & Wilkinson, Blairsville, Pa., 1-3-5 cock, 4 hen, 1-2-3 chl., 1-2 pl., 1 old pen, 1 young pen. Oren Hanes, Potsdam, N. Y., 4 cock. Geo. Lyman Hall, Dudley, Mass., 2 cock. R. G. Chattin, Westfield, N. J., 2 hen, 3 young pen. Levi A. Ayres, Granville, N. Y., 1-3-5 hen, 4-5 pl., 2 old pen, 2 young pen. Henry P. Polgreen, Albany, N. Y., 5 chl. John Winter, Sayville, N. Y., 4 chl., 3 pl.

First cock, broad, well built fellow; beautiful saddle hangers, nicely tipped with an open stripe. Second, heavier stripe on top of back; a remarkably flowing, well striped neck hackle. First is striped a little better around into front of hackle; but these two cocks with full necks composed of broad feathers are a splendid quality to see in the class. First hen, excellent type, broad and deep; tail well spread; good head; white back and body; remarkably well striped neck. Second, not quite the substance of first, finer head; strong black parts, including neck and tail coverts. Third, beautifully laced tail coverts. Same on fourth. Same on fifth. First hen has good tail coverts also, but must be handled to be appreciated. First cockerel, silvery white ground color with good black parts; nice type. Second, heavier black striping; good hackle; lacks substance of

CRESCENT FARM White Orpingtons

Our winnings the past show season were made at the two greatest White Orpington shows in America—New York State Fair and Cleveland. At these two shows 495 of the world's best White Orpingtons were out for prizes—over a hundred more than at any other two shows in the United States or Canada. In this stupendous competition.

CRESCENT FARM WON

Hatching Eggs from these superb winners at \$15, \$10 and \$8 per 15, parcel post prepaid. Fertility guaranteed. Free mating list.

O. H. TINDELL No. 2 FOUNTAIN CITY, TENN.

Rolyat Langshans

BIG BLACK BEAUTIES, magnificent green sheen, winners silver cups, bronze medals, shields and coveted blue, both in CANADA AND U. S. Unexcelled utility. Win for customers as well as ourselves. Catalogue free. Hatching eggs, \$5 per 13. Book orders now; dates filling fast. Our supply limited. Rolyat Langshan Yards, Birch Cliff, Ontario, Canada.

BANTAMS America's Finest Bantams. 40 varieties. Game and Ornamental. Shipped on approval. Winners at the largest shows. Stock for sale. Prices reasonable. Cat. 2c. Also choice Pheasants, Yokohamas, Peafowls, and Pit Games. F. C. WILBERT & CO. Grand Rapids, Mich.

winner. Third, a good bodied Wyandotte, having depth of body, nice head, well spread tail. Fourth, short in back, shy in breast; drops wings. First pullet, clean surface of back and body; well laced in tail and neck. Second, a trifle more pleasing shape. In plucking gray feathers over tail in Columbian pullets in order to show off the lacing of the coverts, a certain important quality of Wyandotte type is often lost. Third, a splendidly built Wyandotte pullet. Fourth, some gray in front hackle; tail close together. Fifth, similar.

Silver Penciled Wyandottes—Harry C. Hulse, Aurora, Ont., Can., 1 cock, 1 hen. Albert Brust, Jr., Scranton, Pa., 2 hen.

Magnificent cock in everything required to make him good. First hen, large, very well built, nicely penciled. A magnificent pair.

Black Java—C. Roland Ballantine, Portsmouth, Va., 1 cock, 3 hen, 1 ckl., 1 pl. Wm. H. Clum, Iselin, N. J., 1-2 hen. Hiram W. Schriver, Groton, Conn., 2 pl.

The top of this class was in the first hen, a big, long bodied, well stationed, black eyed hen. The other first prize winners were good, representative Javas.

S. C. Rhode Island Reds—Harold Tompkins, Concord, Mass., 1-2-3 cock, 1-4-5 hen, 2-4 ckl., 1-3-5 pl., 4 old pen, 5 young pen. Prospect Farms, Newark, N. J., 4-5 cock, 5 ckl., 4 pl., 2-5 old pen, 1-2-3 young pen. H. E. Watts, Monmouth Beach, Mass., 2-3 hen, 1 ckl., 2 pl., 1 old pen, 4 young pen. Lester Tompkins, Concord, Mass., 3 ckl. B. McL. Quackenbush, Darien, Conn., 3 old pen.

First cock, big, long bodied, could stand better finish of tail; rich red color, free from black in neck, with neck matching wing bows and back. Second, well finished bird in tail; same kind of neck. Remarkable how these birds match from neck to back and from fluff to back; a rich tone of color. Third, cooped in lower tier; can't see him; this rich dark color of the east looks black in dark light. Double tiering is bad way to show Reds. Fourth, old New York champion. Won second at Boston this year. Gone by for this show. First hen, big, long bodied, horizontal back; level color all over, only lower breast shading off a little bit. Second, another big, long bodied female; same rich color; better breast than winner, matching all over; weaker in wing flights; also fails to winner in droopy eyelid and facial expression. Third rougher feathered bird; rougher shanks. Fourth, smooth feather, smooth shanks; heavy in comb; trickle long in shanks; but such smoothness of feather is going to win out. It is harder to get under color on a hard feather than on a silky feather, but finish is important. First cockerel, beautiful sheet of rich level color; hackle matches wings and back as well as we ever saw. This bird was shown at Philadelphia where he won first, and is getting coop tired. Appears trike high in station, but when feeding better in the home yards will show in better form. Second, a better bodied bird than winner; same bright eye and large open face, similar dark color, matching all over, but fails to winner in saddle. Third cockerel, another strong headed bird; red eye, good type, broad feather, neck matches well. Said Lester Tompkins: "We do not breed muddy wings in east to get hackles free from black that matches." First pullet, big, well grown specimen; good head; rich, even color all over. Second, smooth feather, rich ground color; tendency to orange on outer edges of hackle. Third, grand big bird, long, well balanced body, smooth, broad feather; fails little in under color. Fourth, another big, long pullet; not quite as smoothly webbed in plumage. Fifth, again shows size, type and rich level color; deep under color. Little ticking in female hackle does not seem to matter, but notice here and there a pullet that has had tip end of hackle feathers nipped off. This is more objectionable than ticking.

R. C. Rhode Island Reds—Ralph Knickerbocker, Pine Plains, N. Y., 5 cock, 2 young pen. Harold Tompkins, 1-2-3-4 cock, 1-2-3-4 hen, 1-3-4-5 ckl., 1-2-3-4 pl., 1 old pen, 1-3 young pen. Lester Tompkins, 2 ckl. Peter Graf 3rd, Worthington, Pa., 5 pl. John C. Vanderolf, Montgomery, N. J., 4 young pen.

First cock, good head, size, substance of body; well finished cock, with refinement of head and finish of tail all too rarely seen; one level, blended shade of red on a broad feather. Second, even larger bird but fails to winner in comb and finished of tail. Third, a rather lighter colored bird. First hen, splendid head; one shade of rich red all over; not much black in wing. Second, big hen, not as black in tail as winner. First cockerel, big; lacks refinement of comb and finish of tail; splendid body; good length; broad feather of rich color. Second, similar rich color with neck, breast, fluff and back matching as only these eastern fellows seem to know

(Continued on page 396)

Big FREE Catalog RADFORD BARRED ROCKS

SHOWS BIGGER PROFIT - BETTER BIRDS

For eggs—for meat—for show qualities—Radford Barred Plymouth Rocks stand at the top. Radford Barred Rocks are bred for size, early maturity, vigor—combined with great merit as layers and show birds. Radford Barred Rocks won ten out of twelve Firsts competed for at the Milwaukee National November 1921, and all of our matings contain the same rich quality and blood lines. For the back lotter,—for the farmer—for the poultry man Radford Barred Rocks are the birds that satisfy.

Big New Illustrated Catalog Free

It tells all you want to know about Barred Rocks. How we mate to produce winners, all about double matings, history of breed, etc. It tells about Radford Farms. It gives full information about eggs for hatching—about our 100% fertility guarantee—about baby chicks—and all beautifully illustrated. Use coupon and send for your copy today.

and causing the breeder to double mate? First cockerel can be counted on to breed good pullets. Some attractive quality in pullets, with first and third having Wyandotte type and greenish black sheen to plumage.

Buff Wyandottes—G. Arthur Cook, East Hampton, Mass., 1-3 cock, 2-3 hen, 2-3-4-5 chl., 1-2 pl., 2-3 old pen, 1-2 young pen. W. S. Crandall, Elsmere, N. Y., 2-4 cock, 5 hen, 1 chl., 3-5 pl., 1-5 old pen, 3-4-5 young pen. Matthew Boyd, Cuyahoga Falls, Ohio, 5 cock, Frank Ritchie, Patchogue, N. Y., 1 hen. Stuart A. Howland, Granville, N. Y., 4 hen. Percy B. Hall, Dudley, Mass., 4 pl. F. W. Spalding, Poultny, Vt., 4 old pen.

The best class ever put down. First cock has size, type and a uniform sheet of lustrous buff; clear tail. Second, fails to winner in finish of tail and fullness of breast. Third, trifle heavy in comb; tail covering a shade darker than back. Fourth, a good Wyandotte, broad, nice top color; breast a shade lighter, making two-color bird. First hen, good type, level buff color that runs down to the skin. Second, smoother web of feather; smoother feather; level, lustrous color; better shape of tail; fails in small, narrow comb. Third, big hen; clear wings and tail; loses in uniformity of color to other two. Fourth, trim hen, large, smooth feather. Fifth, another smooth colored female. First cockerel, nice type; rick, lustrous buff; tail needs little more covering. Second, beautiful cockerel; smoother feather; level, lustrous color; broad tail coverts with tail nicely covered; needs trifle more depth to breast. Third, a close runner-up. Fourth, big; beautiful color; needs trifle more filling in front of tail. Fifth, big, soft, tone of color; trifle more station than others. A remarkable string of cockerels. Little rolly-polly fellows out of it. First pullet, smooth sides, well spread tail, nice head, good color. Second pullet on same order; almost shy spike on comb. Such birds are the product of a student. Type that would not be out of place in White Wyandotte class. Third, bright faced pullet; narrows in tail a little; clear wings and tail, of course. Fourth, again good type, smooth feather, soft color. Fifth, long legs, probably young.

Partridge Wyandottes—Buck Bros., Oxford, Mass., 3-5 cock, 2-5 hen, 1-3 chl., 2-3 pl. Roy C. Lester, Darien, Conn., 4 cock, 1 hen, 2 chl. Sheffield Farm, Glendale, Ohio, 2 cock, 3-4 hen, 4-5 chl., 1-4 pl., 1 old pen, 1 young pen. H. J. Hunt, Washington, D. C., 1 cock. F. W. Guild, Holliston, Mass., 5 pl.

First cock, rich red fellow; low in tail; nicely striped saddle. Wyandotte shape is not made up of a broad back and a short, low tail. Look at the picture in the standard and read the angle of tail carriage. In looking at Wyandotte males, we see too much of a tendency to get a broad, cobby bird with a short, low tail. Second, fails to winner in comb only; beautiful, long saddle, nicely striped; well furnished tail; sound black breast; a brighter shade of red than winner. First hen, flat head; a cobby hen, nice penciling. Do not agree with judge on first cock and first hen. Would prefer second cock and either second or third hen. Second, larger hen; rich, brownish red ground color; well penciled; good Wyandotte type. Third, another big hen, rich ground color, nicest lines of penciling in class. First, second, third cockerels, bright red ground color, nicely striped; good size. Both first and second have good carriage and finish. First not a short backed bird. First pullet, good size and type, strongly penciled all over. Second, orange neck, darker shanks. Third, pencils are heavy.

Columbian Wyandottes—Wilkinson & Wilkinson, Blairsville, Pa., 1-3-5 cock, 4 hen, 1-2-3 chl., 1-2 pl., 1 old pen, 1 young pen. Oren Hanes, Potsdam, N. Y., 4 cock. Geo. Lyman Hall, Dudley, Mass., 2 cock. R. G. Chattin, Westfield, N. J., 2 hen, 3 young pen. Levi A. Ayres, Granville, N. Y., 1-3-5 hen, 4-5 pl., 2 old pen, 2 young pen. Henry P. Polgreen, Albany, N. Y., 5 chl. John Winter, Sayville, N. Y., 4 chl., 3 pl.

First cock, broad, well built fellow; beautiful saddle hangers, nicely tipped with an open stripe. Second, heavier stripe on top of back; a remarkably flowing, well striped neck hackle. First is striped a little better around into front of hackle; but these two cocks with full necks composed of broad feathers are a splendid quality to see in the class. First hen, excellent type, broad and deep; tail well spread; good head; white back and body; remarkably well striped neck. Second, not quite the substance of first, finer head; strong black parts, including neck and tail coverts. Third, beautifully laced tail coverts. Same on fourth. Same on fifth. First hen has good tail coverts also, but must be handled to be appreciated. First cockerel, silvery white ground color with good black parts; nice type. Second, heavier back striping; good hackle; lacks substance of

winner. Third, a good bodied Wyandotte, having depth of body, nice head, well spread tail. Fourth, short in back, shy in breast; drops wings. First pullet, clean surface of back and body; well laced in tail and neck. Second, a trifle more pleasing shape. In plucking gray feathers over tail in Columbian pullets in order to show off the lacing of the coverts, a certain important quality of Wyandotte type is often lost. Third, a splendidly built Wyandotte pullet. Fourth, some gray in front hackle; tail close together. Fifth, similar.

Silver Penciled Wyandottes—Harry C. Hulse, Aurora, Ont., Can., 1 cock, 1 hen Albert Brust, Jr., Scranton, Pa., 2 hen.

Magnificent cock in everything required to make him good. First hen, large, very well built, nicely penciled. A magnificent pair.

Black Java—C. Roland Ballantine, Portsmouth, Va., 1 cock, 3 hen, 1 ckl., 1 pl. Wm. H. Clum, Iselin, N. J., 1-2 hen. Hiram W. Schriver, Groton, Conn., 2 pl.

The top of this class was in the first hen, a big, long bodied, well stationed, black eyed hen. The other first prize winners were good, representative Javas.

S. C. Rhode Island Reds—Harold Tompkins, Concord, Mass., 1-2-3 cock, 1-4-5 hen, 2-4 ckl., 1-3-5 pl., 4 old pen, 5 young pen. Prospect Farms, Newark, N. J., 4-5 cock, 5 ckl., 4 pl., 2-5 old pen, 1-2-3 young pen. H. E. Watts, Monmouth Beach, Mass., 2-3 hen, 1 ckl., 2 pl., 1 old pen, 4 young pen. Lester Tompkins, Concord, Mass., 3 ckl. B. McL. Quackenbush, Darien, Conn., 3 old pen.

First cock, big, long bodied, could stand better finish of tail; rich red color, free from black in neck, with neck matching wing bows and back. Second, well finished bird in tail; same kind of neck. Remarkable how these birds match from neck to back and from fluff to back; a rich tone of color. Third, cooped in lower tier; can't see him; this rich dark color of the east looks black in dark light. Double tiering is bad way to show Reds. Fourth, old New York champion. Won second at Boston this year. Gone by for this show. First hen, big, long bodied, horizontal back; level color all over, only lower breast shading off a little bit. Second, another big, long bodied female; same rich color; better breast than winner, matching all over; weaker in wing flights; also fails to winner in droopy eyelid and facial expression. Third rougher feathered bird; rougher shanks. Fourth, smooth feather, smooth shanks; heavy in comb; trickle long in shanks; but such smoothness of feather is going to win out. It is harder to get under color on a hard feather than on a silky feather, but finish is important. First cockerel, beautiful sheet of rich level color; hackle matches wings and back as well as we ever saw. This bird was shown at Philadelphia where he won first, and is getting coop tired. Appears trinkle high in station, but when feeding better in the home yards will show in better form. Second, a better bodied bird than winner; same bright eye and large open face, similar dark color, matching all over, but fails to winner in saddle. Third cockerel, another strong headed bird; red eye, good type, broad feather, neck matches well. Said Lester Tompkins: "We do not breed muddy wings in east to get hackles free from black that matches." First pullet, big, well grown specimen; good head; rich, even color all over. Second, smooth feather, rich ground color; tendency to orange on outer edges of hackle. Third, grand big bird, long, well balanced body, smooth, broad feather; fails little in under color. Fourth, another big, long pullet; not quite as smoothly webbed in plumage. Fifth, again shows size, type and rich level color; deep under color. Little ticking in female hackle does not seem to matter, but notice here and there a pullet that has had tip end of hackle feathers nipped off. This is more objectionable than ticking.

R. C. Rhode Island Reds—Ralph Knickerbocker, Pine Plains, N. Y., 5 cock, 2 young pen. Harold Tompkins, 1-2-3-4 cock, 1-2-3-4 hen, 1-3-4-5 ckl., 1-2-3-4 pl., 1 old pen, 1-3 young pen. Lester Tompkins, 2 ckl. Peter Graff 3rd, Worthington, Pa., 5 pl. John C. Vanderloef, Montgomery, N. J., 4 young pen.

First cock, good head, size, substance of body; well finished cock, with refinement of head and finish of tail all too rarely seen; one level, blended shade of red on a broad feather. Second, even larger bird but fails to winner in comb and finished of tail. Third, a rather lighter colored bird. First hen, splendid head; one shade of rich red all over; not much black in tail as winner. Second, big hen, not as black in tail as winner. First cockerel, big; lacks refinement of comb and finish of tail; splendid body; good length; broad feather of rich color. Second, similar rich color with neck, breast, fluff and back matching as only these eastern fellows seem to know

(Continued on page 396)

Big FREE Catalog RADFORD BARRED ROCKS

SHOWS BIGGER PROFIT - BETTER BIRDS

For eggs—for meat—for show qualities—Radford Barred Plymouth Rocks stand at the top. Radford Barred Rocks are bred for size, early maturity, vigor—combined with great merit as layers and show birds. Radford Barred Rocks won ten out of twelve Firsts competed for at the Milwaukee National November 1921, and all of our matings contain the same rich quality and blood lines. For the back lotter—for the farmer—for the poultry man Radford Barred Rocks are the birds that satisfy.

Big New Illustrated Catalog Free

It tells all you want to know about Barred Rocks. How we mate to produce winners, all about double matings, history of breed, etc. It tells about Radford Farms. It gives full information about eggs for hatching—about our 100% fertility guarantee—about baby chicks—and all beautifully illustrated. Use coupon and send for your copy today.

EXPLANATORY

As to Who Made and Put on the Market the First Wickless Oil Heated One Burner Colony Hover—All Supported by Documentary Evidence Entirely Dependable. Here is Our Explanation:

IN the February issues of a few of the leading poultry journals we published our answer to this question in what we believed to be a convincing form as it relates to the truthfulness of our claims to be the originators of the Colony Hover such as we are now advertising. We asked the buying public to judge for themselves as to the evidence submitted. We reiterate here our belief that the buying public is not much interested in controversies relating to patents or priority discoveries. The merit of the article, what it is, what it does, what it stands for, and the benefits to be derived from its use—the results, after all, are what count. If it works well and endures satisfactorily it will win favor, irrespective of patent claims or other controversies.

In making this further explanation, which we hope will be the last, we are simply defending our rights, not changing our advertising policies in the least. Our advertising campaign, as originally planned at the beginning of the season, continues unchanged. We will confine ourselves to the bare facts, in each statement, as we always have, in every public announcement—advertisement or otherwise. Our understanding is that our competitor in this city expects to use considerable space in this month's issues of a few of the leading poultry papers—not to answer our advertisement—it is unanswerable, but finding that patent claims on numerous things referred to, foreign to the subject, such as fireless cookers, washing machines, engine starters, anti-rooters for hogs, etc., etc., will not work well in their desperate effort to make a mountain out of a molehill, or to support their claims of hover priority, statements not based upon facts, all misleading, confusing and meaningless, they now attempt to lead the public thought away from the main issue by other means. Our claims are based upon these facts, pure and simple.

We are the originators of the Wickless Oil Heated Open Burner Colony Hover. We are not talking about burners or other heating devices. All burners are more or less standardized. There were many burners at that time on the market used on oil stoves. We called attention to several patents relating to burners in the last part of our February answer. This point needs no further explanation. Heating devices were numerous then. They are now. But the application and control of these heating devices as applied to Colony Hovers the Reliable way is ours. That is quite another question and we will now proceed to prove our claims, using as a basis the announcement submitted by our opponents.

FIRST: We have always made our own Hovers. We never bought a Hover from this claim-to-be competitor or from any other concern. We have always manufactured these Hovers in our own factory. It is our invention. We have our patents. Certain parts of the outfit were bought outside. This competitor made some of these parts for us. We visited their factory frequently. We did not at that time have a machine shop; we needed to have

certain parts made. We contracted for these parts in the usual way, bought them and paid for them. That was all.

SECOND: As evidence of this fact we hold receipted bills. One is of peculiar interest. Rendered by the H. M. Sheer Co., dated March 29, 1918, for \$37.10. It reads:

1 set master patterns for Colony Brooder, Door and Frame.

1 special regulator for Colony Brooder. These were made for us, ordered by us, made from our design and were in no way used or identified as any part of anything manufactured by Sheer for other purposes at that time. They were our major patterns and so billed, for which we hold receipt.

THIRD: A reproduced purchase order of February 25, 1918, clearly shows our order for parts to be used with our Hover. Anyone can clearly see what this order was for.

FOURTH: Our purchase order No. 1190, dated July 25, 1918, reproduced, tells its own story. It was not for Hovers, but for parts. When we placed this order, to safeguard our own interests and to prevent the use of our devices otherwise, we wrote on the order these significant clauses. This was done for self protection:

"These heaters to be assembled as per sample submitted and all pipes to be in two sections as per sample.

"We to be protected at above price for thirty days from date of this order for our future requirements, up to 5,000 additional. Specifications to be given at that time and all to be taken by us by July 1, 1919.

"In case we order 5,000 you agree not to sell the same combination of lamp and regulator to any other manufacturer of canopy hovers before July 1, 1919. You further agree to give us preference on contract for next year beginning July 1, 1919. These contracts subject to delays due to labor troubles, fires, floods, war, civil commotions and accidents beyond our reasonable control."

You will observe that we say "as per sample submitted." It was our sample, our design, that was submitted and we did not propose to have it used as other inventions had been used. It was ours, not theirs. We were contracting for special work for our Hover, not theirs. We were then advertising, as was shown in our answer of February—had been for several months. Their advertisement did not appear until after this particular contract expired and the order was not renewed. Will someone show us any advertisement or announcement of theirs of a similar Hover prior to the date of this order? It cannot be done.

FIFTH: The affidavit of Hubert D. White, reproduced, of which we have a copy, does not mean much. The facts are these: The Reliable Incubator & Brooder Co. is now and was at that time a member of the American Incubator Manufacturing Association. Hubert D. White was Managing Director. As such he visited Quincy to see us as a member of that Association. We took him to the factory of the H. M. Sheer Co., who was not at that time a member of that Association, to see our heating device, the burner which was being made by the H. M. Sheer Co. for our Blue Flame Colony Hover. Mr. White says it was the first he had seen, which was doubtless true. That was in the early part of 1918, long before the H. M. Sheer Co. did any Hover advertising. This burner was being made for us under our specification. Orders were placed later for a quantity of them, a simple business transaction.

SIXTH: August Westman makes a certified

statement, which is reproduced, about the first Oil Blue Flame Heater which was used with our Hover when he was in the employ of the Reliable Incubator & Brooder Co. The statement contains some interesting facts and evidence for us. Mr. Westman, as foreman in our factory, got some good ideas from us which he and others have been trying to capitalize. Further comment is unnecessary. The public may judge for itself.

SEVENTH: The challenge—O, My! that was awfully bad. If we were strangers to these parties, not familiar with the methods employed in many of their transactions, the ways and means of securing patents and inventions, and the blow and bluster of their advertising, as well as their methods of dealing, based upon our experience, we might have been afraid. The challenge is reproduced and perhaps our reply will be. If anyone is interested enough to write us, a copy of our letter will be sent gladly. Some of the \$15,000 referred to in this challenge may be needed for further attempts to explain other things that do not exist in the columns of the poultry journals, or perhaps otherwise. Meanwhile, we will conduct our business as business men should, unafraid, not employing such tactics, continuing to give a satisfactory service to those who entrust their business to us, believing, as we always have, that satisfied and pleased customers are a good asset—much better than non-sensical discussions and explanations.

EIGHTH: All went well as long as we were doing business with the H. M. Sheer Co. Our records show that during the period from January, 1918, to July, 1919, we paid them over \$15,900.00 for these metal parts which we used in connection with our Blue Flame Colony Hovers. At the expiration of our contract, in fact, before it expired, a sadder story begins. Early in the Spring of 1919 we were forced by circumstances, conditions and demands, too exasperating to write about, to go into other markets for our burners and metal parts that we did not then manufacture. It did not prove so bad after all. We not only secured better parts but made a saving of \$7,000.00 on the order we then placed, which included 20,000 burners. Does that mean anything to you, Mr. Poultryman? Isn't it plain to be seen that the underlying fact of this controversy rests upon the loss of our business to them? If we had stood for a \$7,000 loss the poultry papers probably would not have these extra pages to try to explain something of little consequence after all. The holdup man will treat you kindly while he is taking your money, if you make no protest or resistance. He slugs you if you try to protect yourself or defend your rights. Business sluggers are, to our way of thinking, unsafe. We have found them so. The public, when it knows the truth, will think so, too. Only truth endures.

My personal word again is this: I am perfectly willing to enter into a controversy or to fight for the right, if truth and justice is on my side. It is only because of the indignities and the downright injustice of the misleading statements that I am forced to ask an indulgent public to endure this further explanation. I do not intend to allow the public to be misled through any advertising we do if I can prevent it, and when our statements are challenged we are going to see that the public is set right if at all possible. We must protect our good name. For more than forty years we have served the poultrymen of America faithfully and well, a record that we are proud of. I now affirm that I have not digressed from the truth in any statement made in the foregoing. I have tried to explain to the public the facts in this controversy. We have never obtained patents, utilized others' ideas or absorbed others' inventions, without due reward. Our record here in Quincy is well known. This may be more than some can say. We have good reasons for such belief.

The Reliable Incubator & Brooder Co., of which I am President, and my personal interests are all centered in and concerned about rendering an acceptable service to the poultrymen of America. I invite your continued loyal support and co-operation in that direction..

J. M. Myers.

The New 1922

100 to
1000
Chicks

RELIABLE

Standard Coal Burning Colony Brooder

is self heating-
self regulating-
easiest to clean-
burns either hard
or soft coal

The Reliable Standard Coal Burning Brooder is one of the most durable constructed brooders made and with ordinary care will last a lifetime.

IT HAS all the latest patents and improvements with our own designed feed pouch which increases the coal capacity about 10 per cent and has a four-inch collar for a four-inch flue, making it possible to burn soft coal when necessary with entire satisfaction. The ash pit door has screw draft plate that may be opened when soft coal is burned. All Reliable stoves are equipped with two double disc wafers, insuring positive, accurate and dependable regulation. They are guaranteed to be the equal of any coal burning brooder on the market and to give absolute satisfaction. The heater is built of heavy gray cast iron. All parts are strongly bolted together. The base is fireproof, being seven inches high with an asbestos pad attached to lower plate with one-inch air space between it and floor. The grate is one of the Rocker furnace type, self cleaning and will not clog. The fire bowl is wider at the bottom than at the top, thus insuring a clean grate at all times, as the ashes cannot bank up against the casting and burn it out or absorb the heat, thus all the heat is radiated to the

outside. The canopy is constructed to throw the heat evenly to all parts, is self ventilating and built to give service. A small pulley and rope is furnished for lifting the canopy up out of the way for cleaning. The entire construction is so simple and yet so well made that it affords the greatest ease in operation with least care, giving the largest measure of satisfaction.

We make a positive money-back guarantee on all Reliable Incubators, Brooders, Hovers, Poultry Appliances and Equipment.

If there isn't a Reliable dealer in your locality send us the name of one whom you would prefer to deal with; or we will fill your order direct. The Reliable Sales Book tells a complete story.

Reliable Because right

J.W. Myers, Pres.

RELIABLE Standard INCUBATOR

I want you to know that Reliable Standard Incubators have been successfully operated for 41 years. Repeat orders from early customers tell the story of constant satisfaction in the use of the Reliable. Prizes won at the greatest shows and expositions throughout the world is further evidence of Reliable leadership. More than 1,200 winnings. All Reliable Incubators, Brooders, Hovers, Poultry Appliances and Equipment have my personal supervision and direction. I want to give you the name of our local dealer. Write me and I will be pleased to give you the benefit of my 41 years' experience. My advice is that you start early. Let me help you start right.—JOHN W. MYERS, President.

50 to
1100
Eggs

In our 1922 model Blue Flame Hovers we have a heater that is "fool-proof." It is VALVELESS, thus making it impossible to clog up and slow down the oil flow and cause it to go out. Reliable because right. Every burner is adjusted at the factory to the maximum flame so that it is impossible to overflow.

RELIABLE

These Hovers burn ordinary kerosene or coal oil with a clear blue flame with absolutely no fumes or odor and will give all the heat necessary for the comfort of your chicks underneath canopy regardless of outside weather conditions. The late improvements upon the Reliable Blue Flame Hover make it absolutely dependable and one of the easiest operated brooding devices upon the market, and insures raising your chicks with the least work and at the lowest cost. These Hovers are shipped completely assembled and all that is necessary is to bolt the legs to canopy, place the heater where wanted, fill with oil, adjust burner and it is ready to start. They are guaranteed to give satisfaction, or money refunded.

Easy to Kill Rats and Mice

Amazing Discovery Wipes Out Every One—Not a Poison

Rats, Mice, Gophers—in fact all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery, is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency, M. O., Check, etc.) and we will ship you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 740, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and few cents postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days, or your \$1.00 will be cheerfully refunded.

how to produce. First pullet, a broad, smooth feather. The skylight of the Garden sends the light right down on her as she stands in an upper tier, and let her turn as she will, she is just about one shade of color all over.

S. C. Rhode Island Whites—F. W. Cumpstone, Waterford, Conn., 1 cock, 1-2 hen, 1-2 ckl., 1-2 pl., 1 young pen.

R. C. Rhode Island Whites—Wm. P. Palmer, Jr., Cleveland, Ohio, 3 cock, 4 hen, 5 ckl., 3 pl. F. W. Cumpstone, 2 cock, 2 hen, 1 ckl., 1 pl., 1 young pen. Stewart & Byble, Ossining, N. Y., 1 cock, 1-3 hen, 2-4 ckl., 2 pl., 1 old pen. Emma Laurentz, Bridgeport, Conn., 3 ckl., Mamasco Farm, 5 pl., 2 young pen. F. V. Raymond, Bridgeport, Conn., 4 pl.

First Rose Comb cock, good head, distinctive breed type; broad shoulders with length and sweep of back to well finished tail; good station, white color. First hen, shows improvement. Improvement needed in cockerels. First pullet, distinctive.

Buckeye—Myown Poultry Farm, Ellenville, N. Y., 1 cock.

A rare cock; true Buckeye type, rich harmonious blend of color all over of a Rhode Island Red. Owner of this bird has something.

S. C. Jersey Black Giants—Marcy Farms, Matawan, N. J., 1-2-3 cock, 1-2-5 hen, 1-5 pl., 1-3-5 old pen, 2-4 young pen. Wilburtha Poultry Farm, Trenton Jct., N. J., 4-5 cock, 3 hen, 1-3 ckl., 3 pl., 2-4 old pen, 1-5 young pen. Fred M. Rowe, Avon, N. Y., 4 hen. Joseph Raba, Roselle, N. J., 4 ckl., 3 young pen. Joseph M. Hughes, Hamilton Square, N. J., 2-5 ckl., 4 pl. Hiram W. Schriver, Groton, Conn., 2 pl.

Big class, much interest, a number of birds changing hands. Sale of second cock at \$800 reported. This brings out report of offer of \$1,000 on first cockerel. This breed has size. Uniformity of type is seen in first, second cocks and first cockerel. A full but not fluffy feathered type, broad feathers; square shoulders; back drops slightly to tail; tail well finished. Good breadth across wings to center of breast. Good depth from hips to keel lone back of drum sticks. Big abdomens. Type gives full expression to a big, useful, well fleshed chicken. Some tails in females inclined to be pinched. First pullet has good green sheen; a few duller birds, but the finer points are coming. When we saw first cockerel, before the judging, we took a new interest in the possibilities of the breed, and now inspection shows the winning cocks to be similar. Some rose comb and pea comb Giants, with first pea comb cockerel another good bodied bird.

R. C. Jersey Black Giants—Green Lane Farm, 1-2 cock, 1-2 hen, 1-2-3 pl., 1-2-3 old pen.

Pea Comb Jersey Black Giants—Marcy Farms, 1-2 cock, 1-2-3-4-5 hen, 1-2-3 ckl., 1-2-3 pl., 1 old pen, 2 young pen.

Lamona—Bureau of Animal Industry, Beltsville, Md., 1-2 cock, 1-2 hen, 1-2-3 ckl., 1-2-3 pl., 1 young pen.

Shown here for first time. A distinctive addition to the show. More size than a Leghorn. Long bodies, deep abdomens. Good finish in first cock, showing breeding. First hen and first pullet, smooth feathered birds, long, deep bodies.

Light Brahmas—W. G. Minturn, Warwick, N. Y., 5 cock. Harvey C. Wood, Bound Brook, N. J., 1-4 cock, 1-4 hen, 5 ckl., 3 pl., 2-3-5 old pen, 1-3 young pen. J. H. Todd, Jr., Warwick, N. Y., 3 cock, 5 hen, 1 ckl., 4 pl., 5 young pen. C. W. Everitt, Huntington, N. Y., 2 cock, 2 hen, 3 ckl., 1 pl., 1-4 old pen, 2-4 young pen. Erskine T. Brown, Mountainville, N. Y., 3 hen. A. B. Curtis, Sylvan Beach, N. Y., 2 ckl., 2 pl. Aug. Geiger, Hastings-on-Hudson, N. Y., 4 ckl. Jas. L. Baldwin, Philadelphia, Pa., 5 pl.

First cock, big, broad, good bodied cock; nice head, back and tail, clean body color and sound black parts. Second, more under color and sounder neck striping around into front of hackle. Slate runs into some black in fluff. Third, shorter back. Fourth, black in upper breast. First hen, a real one; clean, white body; rich, green neck; clearly laced tail. Second, another beautiful neck and tail; not as silvery white body color; a more richly laced tail never shown. Third, heavier white lacing in neck; big, good bodied hen, holding true Brahma shape without need of poking up. Fifth, lower set hen. First cockerel, has good head, correct back and carriage of tail. Not a sluggish bird. Second, big bird; broad shoulders and back; correct sweep to tail; needs bit of finish on tail. Second, clean colored bird; least bit of rust on lower hackle, neat striping in saddle. Third, black in throat; slate creeps out in fluff; wings not well folded, more angular in type than we like. Fourth, a trifle narrower feather in hackle. First pullet, small comb and trifle fine in skull; excellent back and tail shape; color just about right. Second, would like a rounder breast on a Brahma;

2 World-Beater INCUBATOR Improvements

The Two-Circuit Heating System and Patented Tilting-Chimney

—insure even temperature, need no watching, positively automatic. Hatches by hot water heat; no roasted eggs; insures big hatch and strong chicks. Notice Patented tilting-chimney shown at right.

Extra quality Chicks, 20 cts. postpaid. (Supply Limited.) Satisfaction Guaranteed.
E. B. GRIFFITHS ADDISON, NEW YORK

wings cut into cushion. Third, big, broad female; full breast; legs set well apart; white body color; good tail; neck needs a trifle more green sheen. Fourth, another big pullet.

Dark Brahmas—Henry O. Havemeyer, Mahwah, N. J., 1 cock, 1 hen, 1-5 ckl., 1-4 pl., 1 old pen, 1 young pen. Riverdale Poultry Farm, Riverdale, N. J., 3 cock, 4 hen, 2 pl. E. W. Tripp & Son, Dundee, N. Y., 2 cock, 2-4 ckl., 3 pl. August Fruh, Brooklyn, N. Y., 2-3 hen, C. R. Cline, Warwick, N. Y., 3 ckl., 5 pl.

Good class. Cocks not equal to first Boston. Fifth hen, steel gray color; well penciled; good size. First, second, third cockerels, good size, type and color. More toe feathering would help second. All in all, best showing seen at New York in many a day, and coupled with wonder class at Boston, looks like a pronounced revival of interest in the grand old breed.

Buff Brahmas—H. C. Merrill, Malden, Mass., 2-4 hen, 2 ckl. Myown Poultry Farm, 5 hen, 2 pl. Frank J. Hochrein, Greenfield, Mass., 1-3 hen, 3 ckl., 1 pl. Lloyd M. Hal-lenbeck, Greendale, N. Y., 1 ckl.

First and third hens, great team. Second, smaller, with no feathering on middle toes.

Buff Cochins—A. P. Ingram, West Chester, Pa., 2 cock, 1-3 hen, 3 ckl., 1 pl. W. N. Watson, Sunbury, Pa., 1 cock, 2-5 hen, 2 pl. Lord Dewar, 4 hen, 2 ckl. Aug. Geiger, 1 ckl., 1 young pen.

First cock, exceedingly well put down bird; toe feathering long and well webbed out. This bird has plainly received the care and attention of a loving fancier. A broad backed fellow; one shade of rich color. First hen, broad, deep, round; fluff, breast, wing bows and cushion all round out. Turn this hen any way you will and she shows convex lines of conformation. This is a wide standing hen. One level soft buff all over. Second, a good hen, but not as broad and round. Second cockerel, shown by an English exhibitor, has vulture hocks which should disqualify in America; red color. English ideal requires these two things; altogether different over there. First pullet, built like first hen, black tail. Second pullet, more station.

Partridge Cochins—Aug. Geiger, 1 cock, 1 hen, 1 ckl., 1 young pen. First cock and hen a nice pair.

White Cochins—Mitchel Geiger, Jr., Hastings-on-Hudson, N. Y., 1 hen, 1-2 ckl., 1 young pen. Peggy Wood, Bound Brook, N. J., 3 ckl., 1 pl.

Black Cochins—Michel Geiger, Jr., 1 cock, 1-2 hen.

Black Langshans—M. S. Barker, Thorn-ton, Ind., 1 cock, 2 ckl., 1 old pen, 2 young pen. Mrs. W. H. Craig, Bath, N. Y., 3 cock, 4 old pen. W. A. Meyer, Bowling Green, Mo., 4 cock, 4-5 hen, 2 pl., 2 old pen, 1 young pen. R. P. Keasbey, 175 5th Ave., New York City, 5 cock, 2-3 hen, 4 pl. Miss Donna M. Howe, Springfield, Mass., 2 cock. E. J. Mesick, Aardsley, N. Y., 1 hen, 5 pl., 3 old pen, 4 young pen. Thos. W. Crowe, 5 ckl., 5 young pen. Frank W. DeLancey 2nd, York, Pa., 4 ckl., 1-3 pl., 3 young pen. R. L. Gill, Salisbury, N. C., 1-3 ckl.

A stupendous class of supreme quality. Langshans are labeled on the coops: "A real thoroughbred" and they look it. First cock, a big, well stationed, nicely balanced bird; good tail. Second, magnificent cock; long, beautifully covered tail; good head and back, stands well up. Third, thick in neck, shy in tail finish. Do not know when such a class of hens has been put down before. Not much to choose between the winners. Good heads, backs, tails and station right through. The hens are big, too. First cockerel, big, well finished fellow; wings not up quite as well or underline as good as second. We agree with judge who said second needs only age to make best cock of two. Third, tail lacks finish. Fourth and fifth, rather fuller fanned tails; with fifth failing in breast. First pullet, beautiful profile; not as wide across shoulders as we like. Second, equally good back and tail; broader, with good substance of body. Third, good pullet. Fourth, little narrow at the knees.

S. C. Brown Leghorns—Geo. A. Lewell, Clif-tondale, Mass., 2 cock, 5 ckl. Dr. O. G. Grady, Orrville, Ohio, 1 cock, 4 hen. Allen K. Loury, Lebanon, Pa., 3 hen, 3 pl. H. W. Leibersperger, Reading, Pa., 1 hen, 2 pl. C. Sydney Cook, Jr., West Newton, Mass., 2-5 hen, 4-5 pl. Laurelwood Farm, Pequannock, N. J., 4 ckl., 1 young pen. H. C. Adams, Lynchburg, Va., 1-2-3 ckl. Harold B. Dorman, Bridgeport, Conn., 1 pl.

First cock, nice striped cock; good size and type, good head. First hen, finely stippled; nice type. Second, black shaft in feather. First cockerel, bright colored bird, with neck matching back better than first cock. Second, nicely finished cockerel; trifle

SILVER CAMPINES

GREEN SHEEN STRAIN

Again Champions at the Great
Chicago Coliseum Show
Dec. 6 to 11, 1921, where I won

Cock	Hens	Cockerels	Pullets	Old Pen	Young Pen
3	2	2	3	1	1

My birds were the admiration of many judges and breeders, and were recognized as superior to all former exhibits. This is the tenth consecutive time that my birds have been the champions of the great Chicago show. Breeding pens now mated. Mating list ready for mailing. My birds are single mated and exhibition birds are mated together. No trick back of these birds.

Campines are fast growers, plump at all ages, heavy layers of large, white shelled eggs and eat less than Leghorns.

I have the largest plant devoted to the raising of exhibition and high record Silver Campines in the United States. My birds have been linebred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 69 males placed under ribbons at the Coliseum Show in last ten years. During the same period, I have had 160 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history.

Write me for information. Your absolute satisfaction is guaranteed.

FRANK E. HERING Desk B SOUTH BEND, IND.

"950" CHICK RAISER Trade Mark IT'S BAKED AND MEDICATED

Would you feed a new born calf hay and ear corn, or a day old pig, corn? Then why feed baby chicks raw chick feed, and expect to raise a large per cent of them. It can't be done. Thousands of chicks die annually because of feeding raw chick feed, causing indigestion, and then diarrhea.

"950" CHICK RAISER, is a scientific discovery of the H. M. SPAHR BREEDING ESTATE. For years we made the fatal mistake of feeding raw indigestible feed and killed thousands of our valuable chicks. For several years since feeding "950" CHICK RAISER, which is baked and medicated, our mortality loss has averaged 5 per cent. Nine hundred and fifty raised out of a thousand. "950" CHICK RAISER, is a baby chick feed that is easily digested and will "SAVE THE BABY CHICKS." Stop losing baby chicks, feed "950" CHICK RAISER. ORDER TODAY.. SPECIAL INTRODUCTORY PRICE.

1 large size can	"950" CHICK RAISER, .75 postpaid
2 large size cans	"950" CHICK RAISER, \$1.25 postpaid
4 large size cans	"950" CHICK RAISER, \$2.25 postpaid
6 large size cans	"950" CHICK RAISER, \$3.00 postpaid

Money back, if it fails to raise a higher per cent of chicks than any other chick feed on the market. Our formula for baby chick scratch feed, easily made at home, and our entire system for successfully raising baby chicks given absolutely FREE with every order for "950" CHICK RAISER. ORDER TODAY, and "SAVE THE BABY CHICKS."

H. M. SPAHR BREEDING ESTATE Dept. 45, Woodsboro, Maryland

5th Prize.....	500 lbs.
Next 10 Best.....	400 lbs.
Next 15 Best.....	300 lbs.
Next 25 Best.....	200 lbs.
Next 100 Best.....	100 lbs.
Grand Total...	29,300 lbs.

FEED your chickens *Free*. Simply write a short article (not over 200 words) in plain everyday language (*facts* count, not style) on the subject—

"The Breed of Poultry I Raise —and Why"

You have reasons for choosing a particular *variety* of Plymouth Rocks, Leghorns, Orpingtons, or whatever your choice may be. We want you to state those reasons as a guide to others who wish to raise a better grade of birds or change to another breed, also for the information of beginners in the poultry business.

Nearly a carload of our highest quality feeds will be given FREE, without restriction, to those who write the best stories. Choice is given of Vitality Chick Mash or Vitality Egg Mash, to be delivered by the Vitality Feed Dealer nearest you.

Enter this contest. Write your story. Win a prize and feed your chickens *free*. You're sure to win one of the prizes—go after the big first prize.

The Contest Begins NOW!

Vitality

POULTRY FEEDS

Made by one of America's oldest, largest and most reliable grain companies. Vitality Poultry Feeds are guaranteed to give absolute satisfaction or money back

Chickens-FREE!

Feeds to be Given Away Prize Story Contest Mail the Entry Blank Below

ALL poultry raisers are eligible. Don't throw away this big opportunity, but win a prize and feed your chickens *free*. Simply comply with the rules governing this contest and get your story to us before midnight, April 15, 1922.

Prizes will be awarded as quickly as possible thereafter, and a list of the 155 prize winners announced in the May issue of our poultry publication—"The Vee League." All contestants will receive the April and May issues of this valuable little paper without charge. The stories winning the five capital prizes will appear in the May issue. The editor of "The Vee League" will award the prizes.

It Costs Nothing to Enter

In fact you will be amply paid for your effort whether or not you win a prize. Sending in the entry blank below, properly filled out, entitles you to our poultry manual and egg record book, "Eggs is Eggs," as well as two issues of "The Vee League."

But think what it would mean to win first prize and feed your chickens *free*! Now sign the coupon. Write in your feed dealer's name, as we would like to arrange delivery of your prize through him, in case we do not have a Vitality Dealer in your town. Attach the coupon to your story and mail it in early.

ROSENBAUM BROTHERS, Makers
77 Board of Trade Chicago, U. S. A.

Follow These Ten Rules

- 1 Write only on the subject, "The Breed of Poultry I Raise—and Why."
- 2 Write legibly on one side of paper.
- 3 Tell your story in 200 words or less.
- 4 The contest begins at once.
- 5 Mail your story to arrive before midnight, April 15, 1922, at our office in Chicago.
- 6 The entry blank below, or an entry blank from the local Vitality dealer, properly filled in, must accompany your story.
- 7 In case two or more contestants are tied for any of the prizes, each such contestant will be awarded identical prize.
- 8 Prizes will be delivered through the nearest Vitality dealer, or through the dealer whose name appears on the prize winner's entry coupon.
- 9 Announcement of awards will be made in the May issue of "The Vee League."
- 10 Anyone who raises poultry is eligible to enter this contest, except employees of Rosenbaum Brothers and their relatives. No entry fee is charged.

Preserve Eggs Now Get High Winter Prices

Turn Cheap Summer Eggs Into Winter Profits

Don't sell or eat all your eggs now. Preserve all you can spare; use or sell them next winter and get high prices. Last winter eggs were the farmer's and poultryman's only salvation. Why sell your eggs now at present low prices? Next winter they will be worth three times as much to you. Fresh eggs laid down in K. & G. Egg Preservative will be just like new-laid eggs.

K & G Egg Preservative Keeps Eggs 100% Perfect

K. & G. Egg Preservative is guaranteed to preserve all fresh eggs perfectly for one year. No change whatever takes place. No odor. No taste. Eggs can be used for all purposes. The yolks do not break down. Fresh, new-laid eggs remain fresh a whole year.

K. & G. Egg Preservative is not liquid glass or any other slimy mixture. It comes in powder form and makes a clear solution, clean, cool, and pleasant to put eggs in or take out. No foul odor, strong or stale taste is imparted to eggs. Cleanest, most perfect egg preservative in the world.

Read These Testimonials From Satisfied Users

"We used K. & G. Egg Preservative with very satisfying results. We consider it superior to water glass. Eggs preserved are in very fair condition at this time." (Jan. 1, 1922.) J. L. Miller, Comm. Dept. Food & Drugs, State of Indiana, Indianapolis, Ind.

"Can safely say K. & G. is all you claim for it, and then some. I packed 12 dozen in April, 1921, and they sure looked swell." Ben Swanson, Colona, Ill.

"Your K. & G. Egg Preservative is very successful. Had eggs down eight months. Found them all O. K. Will use nothing else." W. H. Woodel, Winchester, Ill.

"I invited all my neighbors to see the wonderful results obtained with K. & G. Bought eggs at 15c; put down 50 dozen. Began using when eggs went to 30c. Your K. & G. is wonderful. Don't see how farmers can be without it." John Bitzer, Waco, Texas.

Double Value of Present Egg Supply

Write for more testimonials just like these and free circular on Egg Preservation. Learn how to double value of your present egg supply. Preserve them now in K. & G. Egg Preservative. Next fall and winter when eggs are high, your preserved eggs will be just like new laid eggs. Big package, enough to preserve 25 dozen, 50c postpaid. Send your order today.

Chatham & Phenix National Bank
Atlantic National Bank

dark in lower hackle. Third, another good cockerel, with well striped saddle. Fourth, coarser texture of comb; not as sound at base of tail. Class of cockerels shows that breeders are giving thought to concave backs. Last year Adams' first cockerel was good in this respect. This year he shows three of this kind. A nice, long, beautifully colored saddle that hangs heavy, fails to raise up the back line with concave sweep to tail. Length of back feather in female and length and breadth of coverts on her tail an important breeding factor in producing a good top line in males. Bright had one such female at Boston, with several more at home; she had the best cockerel breeding feather we had seen. Regret that illness prevented the participation in shows this year of the famous Grove Hill line.

First exhibition pullet at New York, nice type, smooth color. Small feather in back plumage. If pullet breeding males are to be exhibited, character of exhibition pullet feather will also be important, for feather in the back of this female will also have an influence on the type and back sweep of her males.

S. C. White Leghorns—A. & B. Schilling, Rochester, N. Y., 5 cock, 1 hen, 1-4 ckl., 1-3 pl., 2 old pen, 2 young pen. Henry P. McKean, Beverly, Mass., 2 cock, 2-4 hen, 2-3 ckl., 2-5 pl., 4 old pen, 1 young pen. A. & J. Hindman, Newark, N. J., 4 cock, 5 ckl. Frank H. Davey, Yonkers, N. Y., 1 cock, 5 hen, 4 young pen. Wilburtha Poultry Farm, Trenton Jct., N. J., 3 cock, 3 hen, 4 pl., 1-3 old pen. Greenlane Farm, 5 old pen. W. A. Blakeslee, Westfield, Mass., 5 young pen. Elm Poultry Yards, Hartford, Conn., 3 young pen.

Judging was the most satisfactory in several years. Judge, working down the aisle with a female in his hand, woke up each male before touching him for detailed inspection. He wanted to shape birds for general contour, top line and under line, station, carriage of tail and balance on legs. He was not a chicken grabber. First cock, good head, splendid saddle feathering and covered tail; good body, well balanced; a strong bird of good substance. Second, small lobe, texture of comb trifle rough; good length of body; well covered tail. Third, beautiful head; good station; stands straight; good back and underline; tail needs a little more in way of lesser sickles; main sickles long enough. Third, another choice cock; looks like Chapman's second cockerel of last year. Fifth, an old Dan Young bird that has held his youth. Looks little like the bird that he won second on some years ago, the year Davey beat him on an older, better finished cockerel. It seems as if Young put everything into his birds, even longevity. First hen, good head, nice length and curve of back to well carried tail; good underline. Second, on same order; close runner-up; not quite as broad feather in tail coverts; drops stern a little. Third, big, long hen; trifle more angular. Fourth, similar back and tail to first, but fails in comb. First cockerel, splendid head; well curved back to well built tail. Not a dropping tail. This cockerel stands well, with good station, equal to anything ever seen in the Garden. Cockerel, 1223, same exhibitor, a most attractive bird; excelling winner in covering of tail, failing in comb. Second, nice top lines; lacks station of first. Third, lacks underline, points of wings projecting slightly behind rear of body. Fourth, trifle long in blade of comb; same splendid balance of body and style of other birds in this exhibitor's string; not quite the length of body of first cockerel. Fifth, lacks breast; wing points down; coarser texture of comb; not in class with others mentioned. First pullet, well balanced on well placed legs; same back and tail as first hen; good underline, with body as long as wings. Second, same kind of back, tail and body; pure white with golden yellow shanks; slight wrinkle in comb over beak. Third, shade heavier comb; getting ready to lay on day of judging, acting nervous. Fourth, a beautiful pullet; it would be hard to say too much for her. Fifth, more angular. Thus we give you a description of the twenty greatest Leghorns, taking the twenty winners as a whole, that have stood in the Garden since Dan Young was in his glory.

S. C. Buff Leghorns—C. C. Harris, Barneget, N. J., 1 cock, 4 ckl. L. E. Merihew, Marathon, N. Y., 3 cock, 2-3 ckl., 2 pl., 2 old pen, 1 young pen. Monmouth Poultry Farm, Freneau, N. J., 4 cock, 5 hen, 5 ckl., 1 pl., 3 old pen, 2 young pen. Geo. C. Dietz, Arlington, N. Y., 2 cock, Joseph Johnson, Lebanon, Pa., 5 cock. Geo. W. Cisco, Hawthorne, N. J., 1 hen, 5 pl., 1 old pen, 3 young pen. Richard Vanderheid, Hawthorne, N. J., 2-3 hen. Christopher Kraus, Easton, Pa., 4 hen. Glenwood Poultry Yards, Rutherford, N. J., 1 ckl., 4 pl. Geo. W. Rex, Slatedale, Pa., 3 pl. Homer N. Simpson, Suffern, N. Y., 4 old pen. Wm. E. Crevoiserat, Freeport,

PLANS FOR POULTRY HOUSES!

All style. 150 illustrations; secret of getting winter eggs, and copy of "The Full Egg Basket." Send 25 cents. INLAND POULTRY JOURNAL Dept. 40 Indianapolis, Ind.

N. Y., 5 old pen. Greenford Poultry Yards, Silver Creek, N. Y., 4 young pen.

First cock, beautiful sheet of color; do not like comb and lobes. Second, trace of light color on wing bar and at base of sickle; lower set than winner. Third, splendid colored tail; top color not quite as even as winner. Fourth, great cock, gone by. First hen, good type and color; trifle thick in comb; rather narrow feather in back. Second, soft buff; needs better length and spread of tail. Third, beautiful hen; sets little low. Fourth, big hen and good colored one; nice type; except back if inclined to be a little too flat at juncture of tail; trifle heavy in comb. First cockerel, an outstanding bird; good type; tail furnished like a White Leghorn's with broad sickles and coverts. Second, a big, good stationed, well furnished cockerel; neck, wings and back match; tail a tone darker. Fails to winner in comb. Third, again good type, station and furnish; tail a little heavy in color. First pullet, big, good station; splendid substance of body; beautiful back and tail; fine underline; an even shade of lustrous buff all over. This exhibitor has shown some magnificent pullets this year, with the New York winner an outstanding specimen. Second, clear buff, but smaller feather than winner. Third, heavy in comb; level, soft color. Fourth, another good pullet; would look better if first was not cooped alongside. Chickens are only good by comparison; only good until someone puts down a better one alongside.

S. C. Black Leghorns—Clarence M. Davison, Hempstead, N. Y., 1 cock, 1-5 hen, 3 ckl., 2 pl., 1 young pen. Gerald B. Wadsworth, Hempstead, N. Y., 2-3 cock, 2-3-4 hen, 1-4 ckl., 1-3-4 pl., 2 young pen. R. G. Fluke, Warsaw, N. Y., 5 ckl., 5 pl. Mark E. Johnson, Atlanta, Ga., 2 ckl.

Enough different types to afford opportunity for comparison. A tendency for birds of this variety to show angular lines must be eliminated.

R. C. Brown Leghorns—H. S. Lamson, Cameron, N. Y., 3 cock. Wm. T. Liddell, Greenwich, N. Y., 1-2 cock, 1-2-5 ckl. Percy Johnson, Lakewood, R. I., 4 cock, 1 pl. Gus Stadler, Altoona, Pa., 1-3 hen, Deuel C. Lake, Oneonta, N. Y., 2-4 hen, 2-3 pl. E. M. Jewell, Peekskill, N. Y., 4 ckl. Harry R. Blackburn, Harriman, N. Y., 3 ckl., 4-5 pl.

First and second cocks have quality. Third, fair. Fourth, pullet bred. First hen, not as finely stippled as we like. First cockerel shows breeding. Second, some orange in ground color; good head, pretty good type. First pullet, nice type; fair color. Second fails to winner in comb.

R. C. White Leghorns—J. M. Chase, Wallkill, N. Y., 4 cock, 1-2 hen, 3 pl. Craig & Derrick, Bath, N. Y., 2-3 cock, 3-4 hen, 5 ckl., 1-5 pl., 1 old pen, 1-2 young pen. Chas. H. Damon, Ballston, Spa., N. Y., 1 cock, 2 hen, 1-2 ckl., 2 pl. Ernest Palmer, Ottawa, Ont., Canada, 3 ckl. Adam E. Patterson, Jr., Stewartstown, Pa., 4 ckl. Wm. T. Palmer, Granville, N. Y., 4 pl.

First cock, uncommonly neat head; good bodied bird. Second, nicely furnished for a rose comb cock. Third, more cobby. First hen, the back and tail of a single comb, with tail coverts well out on tail. A better wash on this hen would have made her a sensation in the rose comb class. Second, a good female. Third and fourth, fail in comb. First cockerel, a good rose comb; rather sharp at juncture of back and tail; well grown saddle and pretty well balanced body. Such a female as first hen, with her rolled out back and tail, smooth sides and horizontal wings, would do much to make such a cockerel as first a good breeder. Second, nasty disposition. A Leghorn man makes a mistake to breed such a bird; style can never be produced in a nervous, pugnacious Leghorn male. First pullet, high in comb, nice body. Second, shorter, with wings cutting into cushion.

R. C. Buff Leghorns—Wm. Jerry, Woodstock, Ont., Can., 1 cock, 1 hen, 3 ckl., 1 pl. E. A. Vosburgh, Canaan, Conn., 1 ckl. Emerson Light, New Hartford, N. Y., 2 ckl. Nothing to enthuse over. It is "loves labor lost" to analyze such birds.

S. C. Black Minorcas—G. K. R. Game Farm, Chestnut Hill, Pa., 3-4 cock, 2 hen, 2-4 pl., 1 young pen. Prospect Farms, Newark, N. J., 1 cock, 3 young pen. T. D. Hook, Columbia, S. C., 2 cock, 1-2-3 ckl., 5 old pen, 5 young pen. F. E. Paige, Middleport, N. Y., 5 cock, 1 hen, 5 ckl., 3 pl., 1 old pen, 4 young pen. Brish Bros., Frederick, Md., 4-5 hen, 1 pl. A. Didrikson, Whitewater, Wis., 3 hen, 4 old pen. R. H. Anderson, Lynchburg, Va., 4 ckl., 5 pl., 2 young pen, 3 old pen. Meadowbrook Minorcas, 2 old pen.

If there are any bigger birds in the show than the Black Minorcas, we do not know what they are. First cock, tall, long, well finished tail; head free from coarseness. Stands strongly; well meaty breast; great length and strength of body. Second, double coop, allowing him to show off a beautifully

Why do the largest poultry raisers in America choose the International Sanitary Hover?

Here is a small unit hover of only 100 chick capacity, made primarily for home use, and yet its construction is so superior to any other hover made, that it has been adopted by some of the largest commercial poultry farms in America—many of them installing scores of these hovers to take care of their capacity.

Let's see what some of these big poultry raisers say about it:

"I now have an International Sanitary Hover which I purchased over seven years ago. It is still doing as good work as when new, and I still use it for brooding my most valuable chicks."—Charles Key Cullem.

"Gentlemen: This will make eighteen International Sanitary Hovers for me. I have been using eight of these hovers for over five years, and know that there is nothing that can equal them. They are simply the best there are, and that tells the whole story."—L. E. Warren, Warren's Farm, Webster Groves.

"Gentlemen: I am still using the International Sanitary Hovers. I believe that for birds that come from pedigreed stock, or where you are trying to raise good plumage along with good chicks, the small brooder is more successful. The International Sanitary Hover is the best I have ever used."—Maurice F. Delano, Vineyard Haven, Mass. (World's largest poultry farm.)

"Gentlemen: We tried one of your International Sanitary Hovers, and had the best of luck. So well were we satisfied that we have made arrangements to dispose of our brooder system and install International Sanitary Hovers for next season. The best growing chicks we have had were raised in your Hover, and the death rate was nearly nothing."—Oak Dale Farm, Chester, New Jersey.

You will wonder why any one hover could have made such a remarkable reputation among the biggest poultry raisers in America. You may wonder why the 100,000 users of this hover are

so enthusiastic about it. But you won't have any such questions in your mind when you know what the International Sanitary Hover is, and what it does.

The chick raising results that are gotten from the International Sanitary Hover cannot be gotten from any other, because these results are due to exclusive patented construction features. For example, canvas curtain supplies fresh air, without drafts. No smothering chicks. Heated air (no direct heat), radiates down over bodies of chicks. No leg weakness. Warmth at curtain keeps chicks distributed. No crushing. Lamp in separate fireproof cell—no fire, smoke or oil or fumes reach chick area. Lamp and thermometer lift out from top. No stooping. Complete in itself. Weighs only eighteen pounds—as easily carried as a basket.

When you get your copy of our big, beautiful booklet in colors, "Better than a Mother Hen," you will be delighted about what you read and see in this Hover. Send for your free copy today, or, better still, order the hover itself, either from your dealer or from us direct. Remember, this hover is absolutely guaranteed to raise better chicks, stronger chicks, and a higher percentage of chicks than any other brooding device made.

You can now get the International Sanitary Hover complete with electrical unit for \$20.00, or complete with oil lamp for \$13.50. Or one hover with both heating units, which are interchangeable, for \$25.00.

Dr. LeGear Says:

Hatch all your Eggs Raise all your Chicks

START RIGHT: It takes vigorous breeding stock to produce strong, healthy chicks.

Dr. LeGear's Poultry Prescription

will put breeders in sound, healthy vigorous condition, capable of producing highly fertilized eggs that hatch the big, healthy chicks that live and thrive.

THEN SAVE AND RAISE THE CHICKS: Pull them through the first few critical weeks. Build up their vitality to resist diarrhoea, bowel trouble, leg weakness and other chick ailments, with Dr. LeGear's Poultry Prescription which also makes them grow faster, mature earlier, and lay sooner. Chick loss is double loss. Prevent it.

Get this famous prescription from your dealer today. Satisfaction guaranteed or money back.

25c, 50c, \$1.00 packages; 25 lb. pails \$2.50. Except Rocky Mountain States and West.

Guarantee safe arrival of chicks and eggs and will replace without cost every egg paid for that does not hatch. Chick prices: White Leghorns, \$16.00 per 100. Reds, \$18.00 per 100. Egg prices: White Leghorns \$12.00 per 100; 2.00 per 15. Reds, \$14.00 per 100, \$2.25 per 15.

EMORY FARMS

Box A

WHEATON, ILL.

finished tail hung over with large, broad sickles and coverts. Big broad feather in these cocks. Second fails to winner at hocks, being not quite as strong on his legs. These birds not only have length and size of body, but have broad, heavily fleshed breasts. In other words, they have substance. First hen, big, rangy. Second, inclined to be more level or horizontal in carriage of back. Third, big, rangy, rich colored hen; trifle heavier in comb. Fourth, lacks lustre of color. First cockerel, a remarkably well grown, fully finished fellow of good station and length of back: breast fully meaty; stands on strong legs, well set apart. Main tail feathers 2 inches wide. Saddle, broad feather. Tail fully covered with broad coverts. Good comb, wattle, lobe, red eye. Second, another big bodied, long backed, rangy, well finished bird, that stands strong. Close runner-up. Third, another wonderful cockerel; tail covering not quite as well out as other two winners ahead. First pullet, best of the females; big as a hen, long, rangy; green sheen. Second, big, good type; color not as full of life as winner.

S. C. White Minorcas—Hamilton Egg Farm, Rochelle Park, N. Y., 1 cock, 1-2 hen, 1-2 ckl., 1-2 pl., 1 young pen.

A few birds of good size and Minorca type here, but the class as a whole sadly lacks condition. First hen shows real quality, but makes a poor impression account of condition.

R. C. Black Minorcas—T. A. McKittrick, Hudson, N. Y., 1 cock, 1 ckl. Mrs. E. A. Washburn, Taunton, Mass., 1-2 pl. Outshadowed by the Single Combs.

R. C. White Minorcas—B. A. Gates, Afton, N. Y., 1 cock, 1 hen, 1 ckl., 1 pl. Chas. W. Hays, Rockford, Ill., 2 pl. Lack substance of body.

W. F. Black Spanish—Edgar G. Stepath, Westwood, N. Y., 1-2-3 pl. Poor pair.

Blue Andalusians—E. D. Bird, Greenwich, Conn., 5 cock, 4 hen, 1-5 ckl., 1 old pen. R. M. Mosley & Son, Tarentum, Pa., 3 cock, 2 hen, 3-4 ckl., 3-5 pl. Roy E. Bernard, Westfield, Mass., 1 cock, 1 young pen. Walter C. Dobe, Buffalo, N. Y., 2-4 cock, 1 hen, 2 ckl. F. H. Stillwagen, Allentown, Pa., 5 hen, 1-4 pl. Mrs. J. D. Koons, Allentown, Pa., 3 hen. Clinton L. Riggs, Baltimore, Md., 2 pl. Henry Martin, Oyster Bay Cove, N. Y., 2 young pen.

Big and uncommonly strong class of Blues. Three good cocks, well laced into fluff. First hen, splendid type and blue ground color nicely laced. Second, another good female. Third, little smoke on throat. Fourth, shorter, fails in clear ground color. First cockerel, nice head, well laced wing, blue tail; nice up-standing bird. Second, big, long bodied, rangy fellow, nice ground color; could stand heavier lace on lower breast. Third, darker tail; nicely laced breast. First pullet, rangy, long body, nice carriage; pretty well laced all over. Second, sharply laced; rough feather in back. Third, a good pullet; had won first Pittsburgh; well laced; not quite as rangy as first.

S. C. Anconas—H. Cecil Sheppard, Berea, Ohio, 1-2-3-5 cock, 1-2 hen, 1-2-3-4-5 ckl., 1-2-5 pl., 1-2 old pen, 1-2 young pen. R. & W. Ratz, Tavistock, Ont., Can., 4 cock, 4-5 hen, 3-4 pl., 3 old pen, 3 young pen. Frank C. Stier, Lakewood, Ohio, 3 hen, 4 old pen, 5 young pen. Harry H. Hall, Millbrook, N. Y., 4 young pen.

First cock, green black ground color, neatly and evenly ticked on breast, neck and saddle. Second, again good length of body, with well covered tail. Ticking on top not so much like snowflakes. Third, similar to second. Refinement in these birds; not coarsely marked or stiff tailed fellows. Fourth, more cobby. Fifth, not as well finished over tail. First hen, well tipped all over; nice type. Still a few feathers in back to come. Second, darker; neat tipping. Third, nice green ground color; clean tipping. Fourth, beautifully marked bird; bad pupil in one eye. Fifth, again good type and nicely marked all over. Splendid class of hens. First cockerel, good length, station, well finished tail; like first cock, neatly and clearly tipped with white from neck to hocks, with nice saddle tipping. No Black Leghorn tops in first cock and cockerel. Second, another well set up bird with a stylish body; little darker on top than winner. Third, another cockerel on same order. Fourth, good type, nice color. No low set, short backed, high tailed, black topped bird can win in such a line-up. Fifth, good headed, nicely bodied, well tailed, properly set up cockerel; green in color; nice tipping, although not as much of it on back as fourth cockerel. First pullet, tipped all over; neat, clean tips of white on a lustrous green ground color. Splendid type; nice head; and yellow shanks slightly mottled. Judging impressed us as consistent with variety improving under leadership of the judge, except for pullet, 1635, Stier; a good one in head, back and tail; nicely tipped; sounder fluff than winner. Second, more nice type

Hens *need* Vitamines

for More Eggs—Stronger and More Vigorous Chicks

Only hens full of vigor and vitality can maintain a heavy egg production and you get good hatches and sturdy vigorous chicks only from eggs produced by such parent birds. The way to put your birds in such an excellent condition is to feed them a ration rich in vitamins.

SUCRENE BUTTERMILK EGG MASH

has an abundance of vitamins. Your physician or any food expert will tell you that vitamins are the most essential elements in food for any living being. Food lacking vitamins is almost as bad as no food at all. Vitamins give health, vigor, vim and energy; give you a super egg production at all seasons

—which means more profit per hen — and assures good hatches of strong, lively chicks. Your problem of successfully raising them is half solved.

To be sure that you will raise the greatest possible number of your baby chicks, feed them

SUCRENE BUTTERMILK CHICK MASH

Makes Hens Lay and Pay

This is important, especially when you buy baby chicks, because Sucrene Buttermilk Chick Mash is also a "vitamine" feed. It will raise better and more vigorous chicks, developing them to early maturity. Eliminates all chance of bowel trouble so common when chicks are not properly fed.

Pullets raised on Sucrene Buttermilk Chick Mash become good layers on account of their healthy constitution and vigor, developed by the vitamins in the feed.

Prepared by feed experts in our \$2,000,000 plant, Sucrene Buttermilk Egg Mash and Sucrene Buttermilk Chick Mash are composed only of the finest feeding materials including dried buttermilk and meat meal. Guaranteed analysis on every bag.

The poultryman who uses these two Buttermilk Feeds may be sure of success. Try these "vitamine" feeds today. Good dealers everywhere sell Sucrene Feeds. If yours does not, send coupon direct to the mill, which is centrally located and assures prompt service at lowest freight rates.

HATCHING EGGS

from Bartlett's S. C. W. Leghorns

A New Jersey customer writes, "I have bred Leghorns for twenty-five years and from the hundred eggs you sent me, I have 82 of the finest chicks I ever took out of an incubator." No day old chicks. Breeding stock of all kinds. Catalog on request.

Emory H. Bartlett, Box 19, Enfield, Mass.

and clean tipping; trace of purple in ground color. Third, a little past; bare of feathers on head; broken feathers in back. A great bird, evidently been in breeding yard. Fourth, mottled all over, but size of tipping is more variable.

R. C. Anconas—H. Cecil Sheppard, 1-3-5 cock, 2-3-4-5 hen, 1-2-3 ckl., 3-4-5 pl., 1-2 old pen, 1-2 young pen. G. & W. Ratz, 2-4 cock, 1 hen, 4-5 ckl., 1-2 pl. Quality improving with heads much neater; nice backs and tails.

Buttercups—R. W. King, Cornwall, N. Y., 2 cock, 3 ckl. The Cu-ben Farm, 4-5 cock, 1 hen. C. Sidney Cook, 3 cock, 2 hen, 1 ckl., 1 pl., 2 young pen. Chas. C. Cooper, Passaic, N. J., 1 cock, 3 hen, 2 ckl., 2 pl., 3 young pen. Wm. Steck, Cedar Grove, N. J., 3-4 pl. Roselawn Poultry Farm and Hatchery, Ottsville, Pa., 1 young pen. Birds are showing uniformity with type and color being established. First hen and pullet rich ground color with correct black markings; a model team.

S. C. Buff Orpingtons—Campbell Soup Farms, Riverton, N. J., 1-2-4 cock, 1-5 hen, 1-2-5 ckl., 4 pl., 1-2 old pen, 1-3 young pen. Robadel Poultry Farm, Cos Cob, Conn., 3 cock, 5 old pen, 4 young pen. Lucknow Farm, South Norwalk, Conn., 5 cock, 3 hen, 4 ckl., 1-2 pl., 3-4 old pen, 2-5 young pen. Greenlawn Poultry Farm, Richmond, Va., 2 hen, Joseph R. Seitz, 4 hen. W. W. White, Trenton Jct., N. J., 3 ckl. Henrietta E. Hooker, South Hadley, Mass., 3-5 pl.

One could bankrupt the language of the standard describing first and second cocks. Third, not quite as square over shoulders or broad in tail. Fourth, best finished tail we have ever seen on an Orpington cock; a softer tone of buff than first or second; just as massive and well set. Fifth, not quite the length of underline; another big, well colored cock; clean bodied bird. First hen, clean bodied bird; soft, level buff color; little ticking in tail. Second, remarkably smooth colored female; good size; massive. Third, tone lighter shade of color; good type; even buff. Fourth, another smooth colored female. Some wonderfully good hens here this year. First cockerel, big, massive fellow; broad back that carries width all the way out to end of tail; tail well covered with broad coverts. Splendid bone in legs, as white and clean as polished ivory. Second, another big, massive fellow; broader across shoulders than winner; not as clean in tail. Third, younger chicken; not as broad as second, tone lighter color. Fourth, good cockerel; would like him squarer across shoulders; beautiful sheet of color that runs into tail without break; tail a little tight. Fifth, fine top on this bird; could stand little more depth of breast. First pullet, good head, nice profile; uniform sheet of live buff color, with breast matching wings and back. Second, another marvel for uniform, soft buff color; a color neither too light nor too dark and full of life. Third, good head, type and uniform buff color again. Have not before seen such a line of females in the Garden. Fourth, shorter back. Fifth, another fine pullet, failing to others in roundness of breast.

S. C. Black Orpingtons—Alfred Tracy, Sandusky, Ohio, 4-5 cock, 1-5 hen, 3-5 pl. Robadel Poultry Farm, 1-2 cock, 2-4 hen, 1-2 ckl., 1-2 pl., 1-2 old pen, 1-2 young pen. Lord Dewar, England, 3 cock, 3 hen, 3 ckl., 4 pl. T. F. Allen & Son, Norwalk, Conn., 4 ckl. Hillcrest Poultry Yards, 5 ckl., 3 young pen.

Third cock; tremendous feather. An English bird. Hocks rolled out like a pair of bloomers. Cleaner lines are needed to win here. First hen, big round female shown in good condition. Her feathering is extreme enough. Some of the others show the extent to which full feathering may be carried. Third, an enormous depth of body. Too much feathering. First cockerel, a good one; broad feather, covered tail; good head, and all the plumage needed to fill out a good Orpington. Third, big; heavy in comb; shorter in back. First pullet, a good Black Orpington.

S. C. White Orpingtons—J. S. Greenfields, Balmy Beach, Toronto, Can., 1-2-3 cock, 2-3 hen, 4-5 ckl., 4 pl., 5 old pen, 4 young pen. Fred C. Lang, Fort Wayne, Ind., 4 cock. Jill Farm, Plainfield, N. J., 5 cock, 1 ckl., 1 pl., 1 old pen. R. F. Loree, West Orange, N. J., 4 hen. Robadel Poultry Farm, 1 hen, 2 ckl., 5 pl., 2-3-4 old pen, 1-2-3 young pen. Lord Dewar, 5 hen. H. B. Spangler, Matawan, N. J., 3 ckl. James W. Turner, N. Providence, R. I., 2 pl. Wm. Moore, Hamilton, Ont., Can., 3 pl. John R. Johnson, South Windham, Me., 5 young pen.

Keen competition in cocks. First, broad, well saddled fellow; good type and color. Second, not quite as good in top color; good body. Third, a strong, good cock; nice head, deep front. Fourth, another good, big chicken; trifle heavy in comb. Fifth, good top; not quite the length of underline. First hen, nicely put down; big; good depth of body. Second, splendid type; broad shoulders;

Sick Baby Chicks?

Germozone operates just as these people say. It is preventive as well as curative, and satisfaction is absolutely guaranteed. Twenty years on the market. Sold by drug and seed stores at most towns.

Wm. E. Shepherd, Scranton, Pa., wrote: "Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick." Ralph Wurst, Erie, Pa., "Not a case of white diarrhoea in three years." C. O. Petrain, Noline, Ill., "I never had a sick chick all last season." Mrs. Wm. Christiansa, Olive Ridge, N. Y., "Have 800 chicks now 5 weeks old and not a single case of bowel trouble."

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock—for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers.

If no dealer, order by card. Postman will collect. No extra charge. Handy as phoning. 75c and \$1.00 pkgs. Baby Chick Book FREE.

Write today. **F. C. Wilbert & Co., Grand Rapids, Mich.**

smooth sides over wings and cushion; good front. Third, not quite as well set down in front. Fourth, large hen; good color. Fifth, broad shouldered hen; well balanced on legs; not a good wash over tail. First cockerel, good length of body, with full back and tail; good head with bright eye; a good chicken. Second, especially broad across shoulders and full on top; another nice head; a well fronted bird, nicely set. Third, good, fresh head; shorter back; underline not as long. Fourth, heavier skull; tail not as broad. Fifth, more V-shaped. First pullet, good size; nice shoulders, smooth sides; full front and nicely balanced. Second, fuller fluff makes rear end appear deeper, although pullet is really well fronted with good shoulders and back. Third, another magnificent female; wins color special.

S. C. Blue Orpingtons—Manetto Hill Poultry Farm, Hicksville, N. Y., 3-5 cock, 1-2 hen, 5 ckl., 2-3-4 pl., 1 old pen. Miss E. H. Allerton, Pleasantville, N. Y., 1 cock. Mrs. Annie Taylor, Central Park, N. Y., 2 cock, 5 hen, 3 ckl., 5 pl. M. J. Ryan, Phillipsburg, N. J., 4 cock. B. C. Roecker, Phillipsburg, N. J., 3 hen, 2-4 ckl., 1 pl. The Brighthouse Farms, Roslyn, N. Y., 4 hen. Wm. Cook & Sons, Scotch Plains, N. J., 1 ckl. More blues than seen in a long time, and better than in some years.

A. O. V. Orpingtons—Dr. Geo. B. Edwards, Laceyville, Pa., 1 cock, 1 hen, 2 ckl. W. H. Winters, Moosic, Pa., 1 ckl., 1 pl. **Silver Grey Dorkings**—Frank Edwards, Newton, Mass., 5 cock. Chas. H. Yapple, Richford, N. Y., 4 cock, 4-5 hen, 3-5 ckl., 2 pl. Watson Westfall, Sayre, Pa., 2-3 cock, 1-2-3 hen, 1-2-4 ckl., 1-4-5 pl. Lord Dewar, 1 cock, 3 pl.

Nothing like the Silver Greys here can be seen anywhere else in North America. Great length of back and underline in first and second cocks; well set down on legs; with silvery white top color, full hackles and sound black breasts and tails. Westfall's first hen, a big, long bodied, beautifully stippled female. First pullet again good. Third pullet, shafty; expected a better female than this from England.

White Dorkings—Chas. H. Yapple, 1 cock, 1 hen. Good pair.

Colored Dorkings—Chas. H. Yapple, 1 cock, 1 hen. Magnificent, big, long, well set pair with good color.

Dark Cornish—Greenlawn Poultry Farm, Richmond, Va., 4-5 cock, 3 hen, 5 ckl., 1 old pen, 2 young pen. Courtland H. Smith, Warrenton, Va., 3 cock, 1 hen, 4 pl. Stuart D. Talbot, Edmoston, N. Y., 2 cock, 4 ckl. Lord Dewar, England, 1 cock, 2 hen, 3 ckl., 1 pl. Silas H. Andrews, Mineola, N. Y., 4-5 hen, 1-2 ckl., 2-3 pl., 1 young pen. Greentree Poultry Farm, Manhasset, N. Y., 5 pl.

First cock, big, heavy boned, square shouldered fellow. Second and third, good cocks. Fourth, black neck and saddle. First hen is a Cornish man's dream; heavy bone; short legs; broad shoulders, whipped tail. Some criticism on this type, however. Considerable feeling that little more leg is desirable. For one thing the standard does not picture an Azeel. Second hen, another broad, heavy boned female. First cockerel, big; wide legs; heavy bone; good shoulders; about the length of leg called for by standard. Get a bird down to the ground, and broad but not thick through, and you lose reproduction qualities, which means eggs. Second, dark bird; neck lacks red in quill. First pullet, typical broad, well set bird; strong back that narrows at tail; good bone.

White Cornish—Andrew O. Olsen, Jamestown, N. Y., 2 hen, 1 ckl. Isle of White Poultry Farm, Winslow Jct., N. J., 1 hen, 2 ckl., 1 pl. Small class; good quality.

White Laced Red Cornish—Courtland H. Smith, 1 cock, 1 hen, 1 ckl., 1 pl. First hen good; first cockerel, another well laced specimen.

Speckled Sussex—A. & B. Schilling, Rochester, N. Y., 5 cock, 1 hen, 5 ckl., 2-4 pl., 2 old pen. Joseph Preece, Ft. Washington, Pa., 3 cock. R. E. Haeger, Algonquin, Ill., 1-2-4 cock, 3-4 hen, 1-2 ckl., 1-5 pl., 1 old pen, 1 young pen. Pioneer Poultry Plant, 5 hen. J. De Ver Rogers & Son, Oxford, N. Y., 2 hen. A. & E. Tarbox, Yorkville, Ill., 4 ckl., 3 pl. Wm. H. Whitem, Philadelphia, Pa., 3 ckl.

First cock, tremendous size; long back; uniformly marked all over. Second, heavy in comb, higher in tail. Third, long bird; not as well mottled in neck. Orange colored males are a thing of the past. First hen, magnificent specimen; deep body; large frame; rich ground color; every feather barred with black and ending in a clean white tip. Second, heavier black bar; trace of gray in white tips; slight shafting in red ground color of back. Third, nice hen; little shorter in underline. Fourth, white tip not as clear. Fifth, breast not as regularly tipped. First cockerel, big, nice back; well marked; dark in lower hackle. Second, nicely marked;

THE WORLD'S GREATEST STAFF OF INSTRUCTORS IN POULTRY CULTURE

**American Poultry School is Making
Poultry Raising Easy for Over
40,000 Men and Women**

Practically all readers of poultry publications have come to accept the very name of Quisenberry as indicative of simplified methods in poultry culture

that bring unflinching success. Prof. Quisenberry is at the head of the strongest and most practical staff of instructors in Poultry Culture ever assembled for teaching.

Harry R. Lewis is Vice-President. He was formerly with the New Jersey Experiment Station. He has placed his own poultry farm at the disposal of the school for demonstration purposes in testing out new ideas and formulas for the benefit of students of this school.

A Great Institution—More than 100 people are employed in assisting the faculty in the efficient grading of lessons, writing personal letters to students, solving particular problems. "The Quisenberry Way Makes Every Hen Pay"—is the slogan bestowed upon the practical course of instruction originated by T. E. Quisenberry and elaborated by other members of the faculty. No school in the world has a larger faculty composed of more prominent or successful poultry experts. This institution has the endorsement of the biggest people in the poultry world. Experts have testified that the value of the instruction given by the American Poultry School cannot be measured in dollars and cents. They know, as thousands of others have come to know, that the profits and poultry knowledge gained from the simple course of instruction sponsored by the American Poultry School are permanent—not only for a day, a month, or a year—but for life. It brings lasting success.

Others on the Faculty are V. O. Hobbs, former President of the Missouri State Poultry Board and one of the world's

PEDIGREED, TRAP-NESTED OFFICIAL CONTEST CHAMPIONS

S. C. White Leghorns, White Wyandottes, S. C. R. I. Reds

AGAIN WE LEAD

OVER
300
EGGS
PER YEAR

Latest report from the Texas National Egg-Laying Contest shows a S. C. W. Leghorn pullet of ours—sired by Victory's Chief—leads entire contest for winter egg production. Simply additional proof of the superior laying qualities of our bred-to-lay stock over all competitors at a time when eggs pay their biggest profits.

A few other American poultry farms have produced over-300-egg hens. That is true. But here follows the story of a

Continuous Winning Streak Dating Back Through 9 Whole Years

Not only is that true, but it has the unquestioned backing of Official Contests Records to prove it fact. Let's start with pens: 10 of our pens in official contests—60 birds in all—

LAID 13,169 EGGS—OFFICIAL AVERAGE of 220 EGGS Per YEAR Per HEN

Think that over. It amounts to eleven hundred dozen. Multiply this by the average price eggs have brought the past two years. Wouldn't it have paid you to have 60 hens like these right in your own yard busy on an egg-laying job like that?

Then our individual contest champions—on all three breeds. HERE ARE THEIR OFFICIAL FIGURES. In the most notable contests of the past nine years, 13 of our World's Champion Layers

LAID 3,263 EGGS—OFFICIAL AVERAGE of 269 EGGS Per BIRD Per YEAR

No unlucky thirteen about that baker's dozen. Such laying is the biggest factor in the making of poultry profits. You may make some profit without it—with it **BIG PROFITS** are sure.

\$13.18 Profit Per Bird

Our pen of S. C. W. Leghorns laid 1,301 eggs per year in American Contest, or approximately 108½ dozen. Selling at average of 75c per dozen, these eggs would bring \$81.30. Deducting official feed cost of \$3.08 per bird would leave a net profit of \$65.90, or \$13.18 per bird.

Sure Proof of Superiority

Eggs are sure if you have the right strain. Have we the right strain to offer you, not on one breed, but on all three of our great breeds? The answer: Our Official Contest Records. We cannot conceive more rigid proof than these victories made in competition with the cream of the country's layers.

VICTORY'S
Pedigree
304x297

OVER 300 EGGS PER YEAR

Two Successive Years

Our S. C. W. Leghorn, "Lady Victory," won American Contest, defeating over 500 layers of all breeds, with 304 eggs per year. Right back the very next year we came with 306-egg "Keystone Maid," triumphing over 1,000 hopes of every breed entered by prominent farms the country over. We are the only farm to produce two over 300-egg hens in successive years, by Official Records. In four years, including her pullet year,

**LADY VICTORY
LAID 1011 EGGS**

illustrating the wonderful year-after-year consistency of our strains-with-the-lay-bred-in.

OTHER NOTABLE CHAMPIONS: 294-egg Wyandotte, "Liberty Belle," 287-egg S. C. W. Leghorn, "Lady Snow," 254-egg S. C. R. I. Red "Red Rose," and a host of other winning individuals and pens much too numerous to mention here.

Mineralized Water Routs Chicken Lice

Tablets Dropped into Drinking Founts
Banish Vermin, Make Fowls Grow
Faster and Increase Egg Yield.

Any poultry raiser can easily rid his flock of lice and mites, make chicken grow faster and increase their egg yield by simply adding minerals to the fowls' drinking water. This does away with all bother, such as dusting, greasing, dipping and spraying. The necessary minerals can now be obtained in convenient tablets, known as Paratabs. Soon after the fowls drink the mineralized water,

all lice and mites leave them. The tablets also act as a tonic conditioner. The health of the fowls quickly improves. They grow faster and the egg yield frequently is doubled. Little chicks that drink freely of the water never will be bothered by mites or lice.

The method is especially recommended for raisers of purebred stock, as there is no risk of soiling the plumage. The tablets are warranted to impart no flavor or odor to the eggs and meat. This remarkable conditioner, egg tonic and lice remedy costs only a trifle and is sold under an absolute guarantee. The tablets are scientifically prepared, perfectly safe, and dissolve readily in water.

Any reader of this paper may try them without risk. The laboratories producing Paratabs are so confident of good results that to introduce them to every poultry raiser they offer two big \$1 packages for only \$1. Send no money, just your name and address—card will do—to the Paratab Laboratories, Dept. 811, 1100 Coca Cola Bldg., Kansas City, Mo., and the two \$1 packages, enough for 100 gallons of water, will be mailed. Pay the postman \$1 and postage on delivery, and if you are not delighted with results in 10 days—if your chickens are not healthier, laying more eggs and entirely free from lice and mites—your money will be promptly refunded. Don't hesitate to accept this trial offer, as you are fully protected by this guarantee.

PACIFIC MO.

more length of back and richer ground color on top would help. Bird in third-prize coop has a cock's spurs. Nice breast on this bird. Fourth, best type in class; long, thick body, well carried tail; good color. This bird lacks age. Would also like whiter shanks. First pullet, snappy white mottling; white crown of head; tight in tail. Second, splendid body conformation; nice tail well covered. Little weak on legs at hocks. Third, rich ground color; nicely marked all over; good type. Fourth, big body; heavy in white mottle. Fifth, lacks substance; fine bone.

Light Sussex—Lord Dewar, 1 ckl., 1 pl. An extra good pair.

Red Sussex—Mamanasco Farm, 1-2 cock, 2-3 hen, 1-2 ckl., 1-2 pl., 1-2 young pen. Myown Poultry Farm, 1 hen. First, second cocks, good eating chickens. Three pretty fair hens. First cockerel good length of body; long legs. Second, black in breast. Nice pair of pullets in all save shanks.

White Crested Black Polish—Henry J. Bartel, Hastings-on-Hudson, N. Y., 2 cock. R. W. King, 1 cock. James Hendree, Palisades Park, N. J., 3 cock, 1 hen, 1 ckl. Walter H. Wilson, Baldwin, N. Y., 2 ckl., 3 pl.

First cock and cockerel, good heads; good substance of body; well grown saddles and nicely covered tails; full necks; beetle green color.

Non-Bearded White Polish—Lewis W. Johnson, Closter, N. J., 1 cock, 1-2 hen, 1 ckl., 1-2 pl. First cock, first, second hens and first cockerel good ones. First pullet, one duck toe; second, better length of back.

Silver Spangled Hamburgs—N. J. Cole, Poughkeepsie, N. Y., 4 cock, 4 hen, 3 ckl., 3-5 pl. J. J. Bryden, Pittston, Pa., 3 cock, 2 pl. Dr. J. S. Wolfe, Bloomfield, N. J., 1-2 cock, 2 hen, 2-4 ckl., 1 pl. Morris Sachs, Hanover Heights, N. J., 3 hen, 4 pl. Chas. A. Grau, Corona, N. Y., 1 hen, 1 ckl. Aug. Fruh, Brooklyn, N. Y., 5 ckl.

First cock, magnificent bird. Tail beautifully hung with white sickles and coverts that end in a sound, pear shaped, green black spangle. A big bird of good type. First hen, small feathers. First cockerel, small bird, poorly finished tail. First pullet, good.

Black Hamburgs—H. Burton, Mt. Airy, N. C., 1 cock, 1 hen. Lord Dewar, 1 ckl., 1 pl. English cockerel is big boned, large lobe, more angular in type than America desires; heavy in head gear.

Houdans—Buck Bros., Oxford, Mass., 2 cock, 2 hen, 5 ckl., 3 pl. W. F. Bast, Phillipsburg, N. J., 1-3-4 cock, 1-3 hen, 1-3-4 ckl., 1-2 pl., 1 old pen. Mrs. John Frame, Alberta, Can., 5 cock. Chester M. Gordon, Jamaica, N. Y., 4 hen, 4 pl. Wm. Mackay, Swift Current, Sask., Can., 2 ckl.

Second cock, one of the biggest and best bodied cocks seen in a long time; a regular Dorking body; well finished tail. Fails to first in crest. First hen, big; long back; deep body; nice tail; clear white mottling. Second, another big hen; not as white in the mottling. A well grown lot of cockerels with good substance of body. More attention to toes needed.

White Houdans—H. F. Goemann, Grantwood, N. J., 2 cock, 1-3 hen, 5 pl. Imperial Poultry Farm, Elizabeth, N. J., 3-4 cock, 4-5 hen, 1-2-4 ckl., 1-3-4 pl., 1 young pen. Chester Beecroft, 501 5th Ave., New York City, 1-5 cock, 2 hen, 3 ckl., 2 pl., 1 old pen, 2 young pen.

A big showing with nice quality throughout. First cock, particularly well bodied. Nice bodies, crest and beards on females.

Red Houdans—Chester Beecroft, 1-2 cock, 1-2-3-4 hen, 1-2-3-4 ckl., 1-2-3-4 pl. An attractive showing. Variety appears to be established. Our fancy would be a darker shade of red to afford greater contrast.

White Faverolles—G. M. Stack, Guilford, Conn., 1 hen, 1 pl. Not as good size as some years ago when D. Lincoln Orr and K. M. Turner were breeding.

Silver Campines—Homestead Campine Farm, Wayland, Mass., 1-2-3 cock, 1-2-3 hen, 1-2-3-4 ckl., 1-2-4-5 pl., 1 young pen. H. R. Smith, West Granville, N. Y., 4 hen. W. C. Frantz, Schnecksville, Pa., 3 pl.

As at Chicago, a shorter bodied cock wins. Second bird has more length. First hen, white neck; barred throat; barred tail; top bars free from frosting. This last is the rarest possible thing to get in a hen. Truly she is a superior female. First cockerel; no chicken in the Garden shows more intelligent breeding; here is good size; beautiful type; length of body; a well balanced body on legs of good station; nicely covered tail carried low. Black eye. This cockerel's plumage is magnificent; the black is full of green sheen; neck is white; throat is barred; the bars on the breast are straight and form ringlets; the white bar of the back plumage is of the right width. It is very easy to get too narrow a white bar. The beauty of this line, for years, has been the length of saddle

Wonderful Layers in Cold Weather

Keep the Nests Clean

Tobacco Stems, 3c the pound; Tobacco Dust, 6c the pound. Special price in ton lots. Add postage to your remittance. A. Hussey Leaf Tobacco Co., 191 No. LaSalle St., Chicago, Ill.; 127 Maiden Lane, New York City.

feather and the clean, nicely proportioned white bar. First pullet, again a wondrous production. She has length, a low tail, neat head parts and clean, sound barring. No wonder the class of Silver Campines is small. It is not a reflection on the beauty and worth of the variety; it is a tribute to the superior merits of this line which discourages competition. But there is no secret to the success of this strain, for intelligent observation, loving care and thoughtful selection are not a secret. We have seen many fine birds in this class at New York shows, but again the variety shows advancement.

Golden Campines—Mrs. B. W. Bairnerd, Ulster Park, N. Y., 1 cock, 2 hen. D. R. Shoemaker, Fort Plain, N. Y., 2 cock. D. H. Christy, Atlantic, Pa., 4 cock. Mrs. C. Sparks, Ooltewah, Tenn., 3 cock. T. O. Perry, Greenwich, Conn., 1-4-5 hen; 2-4-5 ckl., 2-3 pl. C. G. Battles, Wellington, Ohio, 3 hen, 1 ckl., 4 pl. Henry Baumann, Valley Stream, N. Y., 3 ckl., 5 pl. J. N. MacDougall, London, Ont., Can., 1 pl. K. F. Nelson, Moorestown, N. J., 1 young pen.

Quite a big class. First pullet is dark on top, with a narrow golden-bay bar. The golden-bay bar is wider on the breast. Now lift back the wing so you can see where the lower breast joins the back. Two distinct kinds of barring on this bird. Not consistent, all sections matching. Consistency of barring is what has made E. B. Thompson's Barred Rocks great.

First hen has good size and a nice, long back feather. That is important. A small male with a short back feather is nothing much in Campines. Well do we remember when Homestead showed "Palace Boy" in New York. What long, open barred back feathers he had! In second and fifth cockerels, particularly the latter, we have those qualities of Palace Boy; ten years later in the Golden variety, but here at last. The judge puts fifth down because of little white in one flight feather and smooth comb. We offer no objection, except to justify these remarks by saying that progress in the breed may be advanced by encouraging such birds.

A Suggestion From a Reader.

I have been a poultry fancier in an unassuming way for a number of years, and, while I must admit that I have had greater success with the breeding of other animals than poultry, nothing has held my enthusiasm to an equal extent.

The R. C. Rhode Island Red seems to be my final choice and I have not arrived at this without some experience not altogether pleasing to recount, which prompts me to suggest one seeming flaw with most poultry publications that I have read.

Enthusiasm is the very life of any pursuit, and I cannot condemn anyone for boasting of the best, if honestly. But you may read most poultry magazines from cover to cover, and discover nothing else, whereas, I believe that the breeding of good birds is fraught with more pitfalls and disappointments than any other commonly accepted undertaking. I like to look at a thing in a practical way and see my own flock as others see it. Taken in that light my birds seem well above the common average both in quality and production. They are paying well, although I do not keep them essentially for profit, but nevertheless, I cannot afford to forget the costly and numerous setbacks I have encountered. Just so with 90 per cent of all poultrymen. It is a very important aspect of the business and not to be disregarded.

Why, then, are so many of our best articles written in a semi-boastful vein, touching only the high points attained in their (the writer's) complete success. Never a mention of a possible discrepancy.

Even more objectionable is the frequent report of an editor, or assistant who has visited an up-to-date poultry plant. The final conclusion is that he sees nothing but perfection and perfect birds on every hand. I am very keen for any layout of poultry from back yards up, and know no prettier sight than a real poultry ranch, but even with these up-to-the-minute men, I like to look for their weak points as well as the good, and nothing is more interesting than their version, honestly given, of some very disappointing mating, or the partial failure of certain pens to live up to expectations. Even the most successful breeders have their consoling misfortunes. I would like to read and profit by a few of these everyday reverses. It is "all in the game."

This is not to be taken, if you please, as the squawk that follows failure, but as a thought that has been in my mind for some time. We are much inclined to write of ourselves, and word our advertising, "not wisely but too well."

Dr. H. L. Cotton.

Michigan.

BARKER'S

SPECIAL

Poultry Remedy

Used by leading Poultrymen everywhere—and sold to you under a money-back guarantee that if it doesn't do what we promise back goes your purchase price to you. Not a food—but a Remedy that you mix with the food. A real Tonic, Appetizer and Stimulator that never fails. Cartons, 20c, 30c, 60c; pails, \$1.75 to \$3.00; bags, \$1.35, \$2.80, \$5.50, \$10.

BARKER'S CHICK FEED

Will make your chicks strong and healthy, enabling them to make more money for you later by laying more eggs. Begin using it today.

BEES AND POULTRY

GO WELL TOGETHER. When poultry work is heaviest bees need least attention. Very profitable if done right. Easy to learn, small expense to start. We can tell you how out of our fifty years' beekeeping experience. Write today for handsome free booklet, "Bees for Pleasure and Profit." Tell us if you keep bees now, your occupation and home location, so we can better advise you. Begin this spring.
The A. I. Root Co., Box 443 Medina, O.

Horticulture for Poultry Keepers

Conducted by Thos. F. Rigg, Iowa Falls, Iowa.

I expect to set out a family orchard next spring and would appreciate your advice as to the best varieties. I would like to have about 15 different varieties. I have 20 acres of sandy loam, mostly level, but rather poor land, being run down. I would like to have about 40 apple trees and I want to use peach trees between rows and also between each apple tree in the rows.

What kind of manure would be best to use in planting. When should small fruit trees be sprayed? Do you have to wait until they commence to bear? And what would you use? I will give you list of apple trees I have selected, but I will let you give me a list of what kind of paches to put out; would like about six different kinds of peaches. The apples are: 1 Early Harvest, 2 Red Astrachan, 1 Fall Pippin, 4 Baldwin, 4 Delicious, 2 Grimes Golden, 4 Jonathan, 4 Northern Spy, 2 R. I. Greening, 4 Rome Beauty, 2 Stayman's Winesap, 4 Wagener, 2 McIntosh Red, 2 Mammoth Black Twig, 2 Boiken.

If you can see any changes, would like very much for you to change them.

There is a nursery in Ohio that advertises the Delicious. Is that the same as Stark's Delicious? This company does not advertise the Golden Delicious. Would like very much for you to tell me where I can get the Delicious and Golden Delicious. I want Stark's Delicious. H. C. Olds.

Your list of apple varieties is faulty. Advise you to cut out Baldwin, Northern Spy, Stayman Winesap and Mammoth Black Twig. These are not suited to your climate. You should plant Delicious by all means. Also Golden Delicious. For early apples plant Henry Clay, Duchess, and for fall Wealthy is the best of all.

Answering your questions in order put:

Stable manure is best of all fertilizers, as a general proposition. This should be balanced with potash and phosphoric acid. You can buy these materials of dealers in orchard supplies.

Apple as well as other fruit trees should be sprayed as soon as set. For fungus diseases use Bordo mixture, or, better still, use Sulfocide. For eating insects use arsenic of lead. In all probability you will need only the arsenic of lead. Use 2½ pounds of paste arsenic of lead to 50 gallons of water. Spray trees about three times at intervals during season. In fall when trees become dormant spray with Scalecide. This is very important. Scalecide means clean, vigorous trees. Spray again with Scalecide in spring when trees are dormant.

You will be safe in buying Stark Delicious and Golden Delicious of the Stark Co., Louisiana, Mo. This firm is the introducer of these most valuable apples.

Advise you to plant Early Elbert, J. H. Hale and Krummel peaches.

I am contemplating the setting of a few apple trees to replace some that are done with their usefulness and would appreciate your advice as to which would be the best sorts. My orchard is made up of 50 trees and have a few of the following varieties: Northern Spy, Russet, Golden Pippin, Baldwin, Strawberry and an early sweet, name unknown. They call it Harvest, as it is generally ripe at that time. I would like to know which are the best varieties of peaches to make a lengthy season, also plums, pears, and cherries for home use. What size trees do you recommend for spring setting in this location (Montour County) Pennsylvania. H. F. Knapp.

In setting a new orchard, I advise you name. Plant Delicious, Wealthy and Stayman for winter apples. For early and fall fruit plant Henry Clay, Duchess and Wealthy. Plums: Omaha, Terry, Surprise and America. Pears: Seckel, Lincoln, Keiffer and Garber. Garber is a splendid polon fertilizer for Keiffer. Cherries: Montmorency is best of all cherries. Plant no other. Peaches: Early Elberta, Elberta, Rochester and Krummel October.

Would like to know if Stark's Delicious apples will do well in Marinette County, Wisconsin, also what other varieties do well there. I am thinking of locating there and planting an orchard of apples and cherries. Illinois. Wm. Hall.

Stark's Delicious apple is extremely hardy, and will do well in the section you name. Plant Delicious, Wealthy and N. W. Greening. You should plant Montmorency cherries.

I ordered from an Iowa nurseryman last summer 4 apple trees, 1 Peter, 1 Duchess, 1 Wealthy and 1 Whitney No. 20. The soil here is sandy loam and where I wish to set them it can be well manured. Will they bear fruit on such soil or must it be heavier clay. Mrs. Henry Sevensen. Wisconsin.

The lighter sandy soil is best suited to cherries. While apple trees love to have their feet in clay soil, they will do fairly well on the light soil. Feed them plenty of stable manure and cultivate well.

After reading some of your comments in the American Poultry Journal, would like your advice on the question of a truck, poultry and fruit farm along the shore of Michigan, say somewhere close to Holland. Can such a farm, say of forty acres, be made to give a family a living? What do you think of the idea of sending the product to a commission agent in Chicago? Could one find an agent there that would take all the truck, poultry, eggs and fruit, one could raise on such a place? I would rather ship than peddle around in the home market.

Does the steamship service keep up all winter? Is Chicago a good winter market for eggs? I would like to make that my principal product. About how much money would it take to start a place? I was offered 40 acres last spring for \$3,000 with house and barn on it. Do you think that land will be any cheaper next spring than last? If the steamships don't run all winter would the express on eggs be too high to ship to Chicago by rail? Would you advise keeping any milch cows on the same farm, or do you think that one could get a living without them?

Michigan.

William Williams.

A truck, poultry and fruit farm near Holland, Mich., can be made profitable if properly managed. It's all up to the man. Climate and soil are suited to this, and the splendid Chicago market is not far away. Your plan of shipping all your products to one Chicago firm is a good one. You will get better service by doing so and better prices, too. The steamship service is not good during part of the winter, but express rates from Holland to Chicago are reasonable enough. In my opinion good farming land, no matter where located in the United States will never be cheaper than it is today. It will and must advance in price. You will need more than \$3,000 to buy a farm and stock it. A herd of

HATCH EVERY GOOD EGG *with* SOFT HEAT

**Stronger Chicks
Less Expense
Less Trouble
More Money**

Tubeless. Full radiator away with cumbersome, unsatisfactory tubes and pipes.

Smokeless, gasless, odorless. Nothing but pure, moist air reaches egg chamber.

Center Heat. No side lamp. Saves space and weight. Insures equal heating. Radiation from above, as hen supplies it.

Round Egg Chamber
—Just like hen's nest. Makes turning of eggs quick and easy.

Automatic Control
of moisture, heat and ventilation. Requires no attention. Steady, even supply assured, regardless of altitude or weather.

MRS. C. A. ASH, Litchfield, Mich., got 109 chicks from 109 good eggs the first time she ever used a **Porter SOFT-HEAT Incubator**. Roy Klavine, Geneseo, Ill., an inexperienced operator, got 100 perfect chicks from 100 fertile eggs. Mrs. C. A. Saunders, Center, Neb., got 176 strong chicks from 179 eggs, made over \$120 in 4 months, and had 150 chicks left which should make her \$150 more, or a profit of about \$60 a month. Hundreds of Soft-Heat users report 90% to 100% hatches, fewer losses and bigger profits.

Moist Warmth—A Life Saver. Moisture is necessary to life. Both eggs and chicks need it. The Porter supplies it automatically. Simple and certain. You can get big hatches and make easy money with

The Porter SOFT-HEAT Incubator

Duplicates Nature's process exactly. Turns every good egg into a strong, perfect chick. Principle endorsed by U. S. Government. Pronounced the greatest of incubator improvements.

No Suffocation—No Cripples. Eggs don't dry out in Soft-Heat. Moist warmth keeps shells brittle and membranes tender. Chicks break through easily and breathe pure, fresh air instead of poison-laden gases, from the very first. *The Porter hatches no cripples.*

Soft Heat Saves 300% in money, time and labor. 3 to 4 quarts of oil—one filling of tank—completes a hatch. Others burn 4 to 5 gallons and require daily filling of lamp.

Only 2 Minutes' Care Daily. Eggs are turned semi-automatically without removing or lifting tray, reducing necessary care to 2 or 3 minutes a day. A child can operate the Porter.

Make More Money This Year! Take your hatching away from unreliable hens and dead air incubators. Get MORE and BETTER chicks, decrease your losses and increase your profits with the improved Soft-Heat. Use the most scientific incubator ever made. **WE PAY EXPRESS.**

Book Free! Fully illustrated. Explains Soft-Heat in detail. Gives interesting stories of success from many states. Tells how you can succeed and make money from the start with this BETTER hatcher. Send name today—a card will do—for your free copy.

Porter Incubator Co., 5 Porter Bldg., Blair, Nebr.

Barred Plymouth Rock EGGS—EGGS—EGGS—EGGS—EGGS EGGS FOR HATCHING

George Beuoy, the man who has done so much to make Capons famous, raises Barred Plymouth Rocks with a national reputation. For more than twenty consecutive years he has bred the one kind only. He specializes on the bred-to-lay kind; exhibits them in the large shows to prove that good ones can be bred from laying stock. Mr. Beuoy has shown his birds at New York, Chicago, Philadelphia, St. Louis, Kansas City, Topeka, Wichita, and more than two hundred other towns, besides winning more first prizes at the World's Fair, Panama Pacific Exposition, than any one other exhibitor. Mr. Beuoy has in all several hundred first prizes won on his bred-to-lay birds against strictly exhibition stock in hot competition. Write to him for a free copy of his new illustrated mating list showing a Barred Plymouth Rock cockerel in NATURAL COLORS on the front page. Low prices on setting eggs. Three matings: Cockerel, Pullet and Standard. A few extra good Cockerels for sale.

Special Low Prices on Eggs in 100 Lots

A Better Summer Spray Saves Money

Higher color, smoother skin and better fungus control follow the use of SULFOCID A Better Summer Spray. As a combined fungicide and insecticide for apples, pears and potatoes, use with Cal-Arsenate. To stop Brown Rot or Leaf Curl on peaches, use alone or with soap—and to insure better carrying and keeping qualities during marketing, spray just before the peaches are picked—a practice that offers extra profit to peach growers. No trace of the spray is left on the fruit. Ask us about the results reported last fall by shippers and commission men. Price \$15. per 10-gal. delivered east of the Mississippi—enough to make 2000 gallons of spray at a cost of 3/4 cent per gal.

dairy cattle will enable you to start off with a steady income and the manure will add to the fertility of the farm.

* * *

Is the country in and around Camden, N. J., troubled with fogs? If so, at what seasons of the year do they appear? Is poultry affected by these fogs?

Mich. Mrs. Mary Douglas.

The country in and around Camden, N. J., is not effected by fog from the ocean to any undesirable extent. Poultry does exceedingly well there, and there are many profitable poultry plants in that locality.

* * *

Will you kindly answer the following questions in American Poultry Journal:

1. How is buckwheat compared with corn or wheat for laying pullets, corn at 85c per bu., wheat \$1.10 per bu. and buckwheat at 70c per bu.?
2. What is the best feed for baby chicks for broiler purposes?
3. What is gluten feed?
4. I have a few grade pullets laying now; would you advise setting eggs from those? I want to sell chicks as-broilers.

Ontario, Canada. Alex. Harvey.

1. Corn is a better and cheaper food for hens than buckwheat regardless of price. Corn and wheat are about the best feeds for poultry, that is, of all grains, and an ideal food for laying hens.

2. There are a number of reliable baby chick foods on the market. Consult the advertising pages of the poultry journals.

3. Gluten feed is a food with the heart of the wheat and all the wheat contained in its makeup.

4. Why not purchase eggs from Standard-bred hens and then be right? Eggs from your pullets should produce good chicks of their kind, and good broilers.

* * *

I am planning to plant a small orchard of 25 or 30 trees and 12 or 15 plums. Would like your judgment as to what varieties to plant to best insure hardiness and to best cover the whole season from very early to very late, both in apples and plums. My ground is first quality black soil, a little sandy, only cleared about 10 or 12 years of heavy timber, near the Cedar river and is high and good air and water drainage. I am also very anxious for your advice as to the kind of trees to plant.

I have been keeping in touch with the work that is being done at the Gurney nursery of Yankton, S. D. I also noticed what you said in the Journal some time ago. I have also kept in touch with the work of the Minnesota Agricultural Society, but I have not seen anything from this society in favor of the use of the Bacota stock. Has this stock been in use long enough to test its value, and would you advise me to use it in my planting? I notice that the McIntosh Red apple is one of the kinds that the Gurney Company uses. Do you think it would stand in north Iowa? I have five trees of the new Minnesota apple, the Red Wing. They have been set three seasons and are making a very rapid growth—from two to two and a half feet per season. They are well balanced, good shaped trees. Would you advise cutting back the ends of last season's growth from one-third to one-fourth.

Iowa. A. W. Penney.

Regardless of the claims of many nurserymen only hardy trees can be successfully planted in northern Iowa. Were I to plant a commercial orchard there I would make it exclusively of Pathon Greening and Wealthy. I would need have no fear of any trees being winter keeled. These apples sell well on the market. I would have abundant crops. I would have a profitable orchard—a money making orchard. The McIntosh Red is hardy enough and is a high grade apple, but I would stick to the two varieties named above. Would not as yet plant trees of Bacota stock except for experimental purposes. What you say

The Vent Treatment Stanfield's Lice Kill

Stanfield's Lice Kill is used and endorsed by poultrymen in every state in the Union and in Canada. One treatment, the size of a pea, rubbed on the fowl just below the vent is guaranteed to kill every louse. Money back if it fails.

of the Red Wing apple tree is good.

You should prune away about one-third of the current growth on young trees making too rapid growth. Do this about the middle of July. If you have a late growing season new growth will push out from the terminals. Remove this in the fall. If you do not their growth will probably be winter keeled.

* * *

Would you please give me a list of hardy fruit trees such as apples, plums, etc., also small fruits that can be successfully grown here in northern Iowa. So many years the blossoms are killed by late frosts. Would like a good variety for family use with a small surplus for market.

Is it advisable to blast the holes for the trees or is it just as well to dig them here. Have black loam soil with clay sub-soil, bordering on the edge of small lake so the soil has enough sand and gravel in it to make it porous and easily worked.

Iowa. S. D. Petersen.

For a home orchard in northern Iowa I would plant Duchess, Wealthy, Molinda and Delicious apple trees. You will find Terry, Surprise and Wanneta plums perfectly hardy. Advise you to plant some of the Prof. Hansen hybrid plums. The Montmorency cherry will do well for you.

In small fruit plant Fay and Redcross currants and Downing gooseberry. Few raspberries are really hardy in northern Iowa. The sunbeam originated by Prof. Hansen, of South Dakota, is extremely hardy. The Betha, Concord and Worden grapes will do well in your section. It is not necessary to blast holes for trees.

* * *

In answer to R. F. Dorran, Arizona: Land can be bought for \$150 to \$200 an acre in central Wisconsin. Level farm land such as you say you want is not suited to a commercial orchard. Surely an orchard should have rolling land, with good air drainage.

Mating R. I. Reds.

You asked me some time ago how I accounted for the fact that my Reds produced such good pullets this year when my strain has always been stronger on the male line. Now I cannot tell you why, but will tell you something about the mating that produced these pullets.

You may remember that I have always used some slate or smut in undercolor. This last year I found that I was getting them a little too dark, some coming nearly chocolate and others with the peculiar wine-like purple cast to the red, so decided last season that I would mate them clean.

I carefully selected a cock of fine type and size. A bird that balanced well and carried his head properly. He had a full breast, broad back, especially at the hips, and stood up solidly on his feet. He was very even in surface and clean in all sections underneath, but his tail was half red and he carried hardly any black in wings.

I picked out a very few females that were clean in undercolor and were otherwise about what I wanted, nearly all being strong in wing markings and with black tails. But remember that these birds on both sides had slate in their ancestry.

From this mating I produced the best pullets I have ever bred. Have a dozen or more fit to go into any ordinary show and have a chance.

The cockerels from this mating do not resemble the sire except in type, being the poorest lot I ever saw. Nearly all have white in undercolor and being generally inferior.

Question is, would any of these cockerels be any good at all as breeders or would they perpetuate their own faults? It really begins to look like a double mating proposition, much as I would hate to admit it.

From another pen that I did not like nearly as well I managed to get a nice lot of cockerels. But the reason for these things is what I would like to figure out. They tell us that Mendel's law is subject to natural variations, but it looks as if it were about 95 per cent variation, and I do not believe many breeders, if they are honest, would claim to be able to tell what any certain mating would produce until they had tried it out.

F. S. Tarbill.

DON'T LET THEM DIE!

ACT QUICK! SAVE THEIR LIVES BY USING

SMOKE-EM

CANNED SMOKE

REG. U.S. PAT. OFF.

THE GUARANTEE ROUP CURE was discovered on our breeding estate, where we breed registered Holstein Cattle, Spahr's Giant Epochal Berkshire Hogs, and our world's famous Nonesuch Ferris White, 300-egg strain Leghorns. After losing several thousand dollars' worth of our valuable birds, we were determined to discover a cure for Roup, Colds, Canker, Diphtheria, Chicken-Pox, etc. We positively GUARANTEE "SMOKE-EM" to effect a complete cure for these dreaded diseases, and will also cure GAPES IN BABY CHICKS, or every cent of your money back.

Read what a nationally known breeder has to say about "SMOKE-EM": "We carry 500 chickens on the farm. In one small house that contained 150 pullets the roup broke out. We removed 40 pullets that I would have gladly given to anyone that would have taken them off the farm. We used one can of "SMOKE-EM" three smokings and strange to say it cured all of the forty head. You have a wonderful roup cure." The HEN CACKLE FARM, Per J. R. M. BOYD, Cumberland, Maryland. Baby chicks hatched from diseased flocks are bound to inherit the disease next fall when eggs are high. BE SAFE and cure your breeders NOW and avoid trouble next fall. The price is very low. WRITE OR WIRE US TODAY FOR FULL PARTICULARS. LIVE DEALERS, we have a good proposition to offer you.

HARRY M. LAMON

Becomes Manager of **OAK DALE FARM**

To Our Friends:

In securing Harry M. Lamon as manager of Oak Dale Farm we are not only in a position to render a greater service to Oak Dale customers, both past and future, but we are giving the world an opportunity to secure Single Comb White Leghorn stock, eggs for hatching and day old chicks from pens mated by this master of poultry breeding.

In bringing to Oak Dale America's foremost poultryman and Single Comb White Leghorn breeder, Oak Dale Farm is again keeping to the forefront in line with its well known policy that it will be satisfied only with the best.

All of our Breeding Pens for 1922 were mated by Mr. Lamon. Oak Dale Farm sent to Washington, D. C., and had him come to LeRoy and personally select every individual that went into the breeding pens for 1922.

THIS IS YOUR OPPORTUNITY—By this master stroke on the part of Oak Dale Farm thousands of people are now given the opportunity to secure Stock, Eggs for Hatching and Day Old Chicks from pens mated by Mr. Lamon.

OAK DALE FARM,
LeRoy, Minn.

To My Friends:

In accepting the management of Oak Dale Farm, LeRoy, Minn., after spending 12 years at the head of the Government Poultry Breeding Work, I want to say that I am now in a position where I can take care of any business that is entrusted to my hands. I mated the birds at Oak Dale this spring and have no hesitancy in saying that they are the most wonderful lot of pens I ever put together. Many high class show birds will come from these matings; also many high egg producers and you may rest assured that I will use every endeavor to fully satisfy every customer in filling orders.

HARRY M. LAMON, Formerly Senior Poultryman
U. S. Dept. of Agriculture, Washington, D. C.

OAK DALE SINGLE COMB WHITE LEGHORNS

Have an Unequalled Record at America's Greatest Show, Madison Square Garden

No one disputes—no one challenges, the question but that the Madison Square Garden Poultry Show is the Premier Poultry Exhibition of the World, and for not only 1 year, 5 years or 10 years, but for 20 years Oak Dale Farm Single Comb White Leghorns met all competitors on this Greatest of Battle Grounds of Poultrydom, and emerged VICTORIOUS and SUPREME.

CONCEDED BY ALL to be the greatest winning strain of Single Comb White Leghorns ever produced and to have left their marks of improvement on the White Leghorn flocks of the world as no other strain has done.

Time after time the MARVELOUS QUALITY OF THIS FLOCK has been the wonderment of all who have seen it. It means simply this, Oak Dale Farm Leghorns are a real strain, as only a strain can go on year after year producing the prize winners not only for ourselves but for our customers all over the country.

Oak Dale Farm,
LeRoy, Minn.

Columbus, Neb., January 12, 1922

The S. C. W. Leghorns you sent me recently arrived in first-class shape. We won first young pen and first pullet. On the cockerel in the first young pen we were awarded the cup for having the best cockerel in the show, all breeds competing. Also the silver medal given by the American Poultry Association.

Yours truly

Matt C. Abts.

EGGS FOR HATCHING

are now ready from the pens that are going to produce winners at America's leading shows and for years past have helped our customers improve their flocks. There are thousands of flocks of Single Comb White Leghorns that contain specimens that are too short on legs, carry their tails too high, too large in comb, especially in males, too short in body, and lack that fine concave sweep to the back that carries a tail at just the right angle. Our Breeding Pens are mated to offset just such defects. They are magnificent in carriage, grand in head points, well up on legs, splendid length of body, with a nice concave sweep to the back, carrying a large, well spread tail at the proper angle and profusely covered with tail coverts. Won't some of this kind of stock help you?

BABY CHICKS

You want eggs for hatching and baby chicks that will lay a large number of great, big white eggs. Then send your orders to the house of the GREATEST FOUNDATION FLOCK OF SINGLE COMB WHITE LEGHORNS IN THE WORLD TODAY. SEND TODAY FOR OUR FREE MATING LIST. It describes in detail all about the finest pens of Single Comb White Leghorns ever mated and gives prices for hatching eggs and day old chicks, etc.

From these same unequalled matings are going to be the first prize and silver cup winners for many of our customers, and I urge you to place your orders now for future delivery.

Oak Dale Farm Harry M. Lamon, Mgr. Box A, Le Roy, Minn.

World's Foremost Poultry Feeding Secrets

Most Remarkable Book on Feeds and Feeding Ever Published

If you want to learn about the most successful feeding methods for poultry of all ages, ascertained after years of experimentation on the part of our best breeders and poultry experts; the best feeding formulas used by the leading agricultural colleges in America; a formula for a standard egg producer that will turn any kind of hens, old, young, mongrels or purebreds, into veritable egg machines; and a great mass of other valuable information on feeds and feeding—then you must have a copy of our latest book on poultry feeding. "World's Foremost Poultry Feeding Secrets."

The one chapter giving a recipe for the Standard Egg Producer is alone worth the cost of the book.

50 Scrub Culls Produce 35 Eggs Per Day

To ascertain the effectiveness of the Standard Egg Producer the Standard Poultry Company of San Antonio, Texas, purchased fifty very low class mongrels, ages 2 to 4 years. The hens looked as though egg production were an impossibility with them. "When we began feeding Standard Egg Producer," reports the Standard Poultry Co., "they were not laying—not even one egg a day. In eighteen days after feeding them the Egg Producer they began laying, and at the end of six weeks, their daily average was 35 eggs. They held this high average until we sold them several months later. We have tested the egg producer with purebreds and with mongrels and in every case it produced a surprising increase in egg production."

Standard Egg Producer Makes Any Class of Hens Lay in Any Season

The Standard Egg Producer is a respecter of no class of hens or seasons of the year. It will make scrubs lay in the winter just the same as purebreds in the spring. If used in connection with artificial lighting, the high egg yield would almost stagger the most skeptical.

The formula for Standard Egg Producer is invaluable to any person who keeps hens for profit, yet it takes up only one small chapter in our wonderful new book on poultry feeding. Some other subjects treated are:

Kinds of food necessary and their respective value—water, green feed, animal feeds, wet mash, dry mash, scratch grains, grit, oyster shell, milk, oats.

How to obtain a balanced ration. How often and how much to feed.

Housing poultry in various climates.

Which is the best breed.

Feed as important as breed.

Poultry diseases.

Profitable age of hens.

How to select the non-layers.

Artificial lighting to increase egg production.

Commercial ready mixed feeds.

How to market eggs.

Why many poultry farms fail.

Preserving eggs.

Best methods of fattening poultry.

Foremost egg producing rations. 57 formulas of scratch feed, dry mash, wet mash, etc., that have been found most successful by leading agricultural colleges.

Feeding chicks.

Best methods and formulas of home made feeds for chicks at various ages—the first feed, starting food, growing mash, feeding the first week, feeding the second week.

How to feed turkeys.

How to feed ducks and geese.

Money-Back Guarantee

This remarkable book will be sent prepaid for only \$1.00 to any part of the world. It is sold on an absolute money-back guarantee—you are to be the judge. If not more than satisfied with the information the book contains, return it within five days and your dollar will be promptly refunded and no questions asked. Sicilian Buttercups.

By. C. Sydney Cook, Jr.

Sicilian Buttercups are one of the oldest breeds of the Mediterranean class, being the only breed known to and kept for centuries by the peasant poultrymen of Sicily. They are, beyond any doubt, an original breed of domestic fowl, by reason of their distinctive comb, both in male and female, unlike that of any other breed.

I am told that a fine flock of these fowls is still kept in the Vatican gardens at Rome, and that a picture of them, painted by one of the old masters, still hangs on the walls of the Vatican.

"Sicilians," as they were then called, were first brought to America in 1858 by Captain Cephus Dawes, in the Barque Fruiterer. When ready to

Typical Buttercup Male. Winner of 1st cock at Buttercup Club meet, Buffalo, 1922.

sail from Sicily with a cargo of fruit, Captain Dawes purchased a number of these fowls, that he might have fresh meat on the voyage home. But they laid so well that he was much impressed with their laying qualities and instead of killing them he brought them all home to Dedham, Mass.

Mr. C. C. Loring, whose farm adjoined that of Captain Dawes, obtained some of the birds in 1860, and bred them for many years. At that time, as today, they had the very unusual, cup-shaped comb, and greenish legs. The fowls were various colors, but by selection year after year, Mr. Loring got them quite uniform, yellow being his favorite color. He also had a few almost white, and they laid the largest eggs. When he got them coming fairly uniform, which was about thirty years ago, he added the name "Buttercup," which indicates the cup-shaped comb, and the brilliant yellow coloring.

In a small booklet published twenty years ago, Mr. Loring describes them as follows:

"Male is of reddish butter color, neck hackle, little darker. Comb is their great and peculiar characteristic, being cup or saucer shape—very taking, legs yellowish willow color, weight 5½ to 7½ lbs., mature very early—3½ to 4 months, small bones and lots of meat, yellow as gold.

"Females. Weight 4 1-2 to 6 1-2 lbs., butter color, saucer cup shape combs, hence the name Buttercups. On back females are laced some, they have a bright wide awake look, yet are quiet in house and out; you cannot help growing fond of them. They lay as well two and three years old as when pullets, and

WAIT! LOOK at MY PRICE

My 1922 offer is the sensation of the incubator industry. Others can't understand how I can sell such a superbly built, scientifically correct hatching machine at such an astonishing price. My answer is that I have smashed all records for big production—built in such huge quantities that I can afford to sell at this almost unbelievable price—and still make an honest profit. Furthermore, there is no "Profiteering" about the

are good till six years old; long, full plump breast, and good table fowls; they combine eggs (which is the real source of profit), meat, fancy; are inclined to lay large, double yolk eggs."

Mr. Loring, without question, is deserving of credit for being the first one to breed, specialize in, improve, and distribute Sicilians in the United States. Perhaps the name "Sicilian" would have been enough, but the name of "Buttercup" seemed so very appropriate that the name "Sicilian" is being dropped and they are known as "Buttercups" almost entirely at the present time.

As far as can be learned, Buttercups were first exhibited in the poultry department of the Centennial Exposition in Philadelphia in 1876, by an exhibitor from an adjoining Pennsylvania county, and they aroused

Typical Buttercup Female. First and color special as a pullet, Buttercup Club meet, Boston, 1921.

considerable interest on account of their peculiar comb.

Mr. Loring also kept some German Antler fowl about twenty years ago, which he bred for five years, but eventually gave up on account of the eggs being so small. This probably accounts for the antler or "V" shaped comb on so many Buttercups today. In fact, I saw a flock of Mr. Loring's original Buttercup stock recently, bred for many years without new blood being introduced, and many had the "V" or antler shaped comb. Some of the females were barred, but mostly laced, as of twenty years ago. Some of the males were brilliant red, and some more orange. One cockerel had the marking of the Black Red Game, and another of a Blue Andalusian. These latter two had evidently thrown back many years. Eight years ago I bred one partially white, but have never had anything but regular Buttercups since that time.

I have before me a picture of the German Antler and Buttercup, that was made twenty years ago. The German Antler has the decided "V" comb, and the Buttercups—both male and female—have good, cup combs, having many points and being set quite close to the head, but both open in the back like many of the combs today.

Our standard at the present time calls for a fowl-shaped about the same as a Leghorn, only a little larger, with a longer body, carried about level. The comb on the male and female described as follows: A single leader

LADY SWEET BRIAR
The 303 egg. Mother of above cockerel

Post's Super Anconas Make 3 Big World's Records

Greatest of all show winners, egg contest winners and the paramount win of all time, in the greatest bred-to-lay classes, all varieties competing. Winning more firsts, specials and cups than any other breeder in North America. Customers doing equally as well; a Pennsylvania customer reports a trap-nest record of 5 pullets, 117 eggs, highest individual, 28 eggs in December, 1921. From the Arkansas State Meet, Little Rock, Ark., customer won 1st cockerel, 1st pullet, 2nd pen, largest show ever held in state; Chicago customer made a net profit of \$4.24 per bird on 28 head; eggs sold at market price. Another winning 1st pullet and special, Kansas City show. Out in Idaho Post's Anconas laid an average of 65 per cent during fall and

beginning at base of beak and joined to a cup-shaped crown set firmly on center of skull, surmounted with firm, well defined, regular spikes. Medium size, fine texture, and free from spikes in center.

Color of male, brilliant, lustrous orange red on neck, back, wing and saddle; tail green; coverts edged with reddish bay. Feathers at base of hackle and on fluff marked with distinct black spangles, flight feather on wings, lower web black upper edged with bay.

Female, brilliant, clear, golden buff, hackle, back, wing bow, saddle and tail coverts brilliant golden buff; ground color marked with distinct elongated black spangles, extending slightly diagonally across the web in parallel rows, with quill and edge of feather gold buff. Body and lower half of breast spangled like back and wings.

Male and female have willow green legs and white or red ear lobes.

Weight: Cock, 6½; hen, 5; cockerel, 5½; pullet, 4.

The principal differences between the Buttercups of twenty years ago and today, are that the combs on both male and female are smaller and more refined now. The color of the males is a little more red than formerly, and the females more brilliant golden color—many of them with distinct black barring where formerly they were more laced, and the black markings not so distinct.

Buttercups are distinctive from the day they are hatched. Chicks are yellow with black spots. They are the tamest of the Mediterraneans and make excellent pets. They have a yellow skin; have more meat on the breast than a Leghorn; and have a comb unlike that of any other breed. They are good layers of large, white eggs. They are hardy and excellent foragers. Feather very quickly and lay early.

They are kept in small flocks all over the United States and Canada, but they have never, to my knowledge, been kept on a large scale. They are very practical for the "back-lotter" or the fancier, and are growing in popularity all the time.

At the Club meet in Buffalo, January, 1922, 150 Buttercups were shown, some coming from as far East as the outskirts of Boston, and as far West as Osage, Iowa; as far South as Maysville, Ky.

Trapnesting

Did you ever stop to think what honest-to-goodness trapnesting means?

It means that you must go into your poultry house not less than four times a day to release the birds in the traps and record on your record sheet the eggs they have laid. In very hot weather you must release the traps oftener than four times a day, lest a hen smother.

And you must tend these traps every day—seven days a week—three hundred and sixty-five days a year. You must not only tend the traps today, but you must do so Christmas day. There is no day off for a ball game, no holiday on the Fourth of July, no Sunday spent at mother's, no vacation trip to the fair, no let up, no freedom.

Buy Candee-Hatched Chicks They are stronger.

CANDEE-HATCHED chicks — healthy, vigorous birds—make sturdy, profitable broilers and layers.

The exclusive Candee double heat control (automatic regulator at heater plus automatic regulator at each 300-egg compartment) assures constant, correct temperature and its ventilating system gives the eggs just the right quantity of air without robbing them of their original moisture.

Place your chicks with a **CANDEE COLONY BROODER**. No crowding, constant uniform heat because of positive automatic regulator, coal magazine, big fire bowl and large 12-inch grate that keeps fire burning evenly. Set regulator, the temperature is automatically maintained. Heavy felt curtain prevents draughts striking chicks.

If you cannot start hatching for yourself and others with the **CANDEE 1200-egg size Incubator**, buy Candee-hatched chicks from one of the thousands of Candee operators now in business and you will have better birds.

Free catalog explains the Candee and gives names of hundreds of operators. Write for it now.

Manufacturers of Incubators, Hot Water Brooding Systems and Colony Brooders.

Now Hatching Eggs Time!!

VERY FORTUNATE is the Poultry Industry and all persons who are engaged in it, because of the fact that the most valuable breeding results in this business can be safely transported almost anywhere in the form of **EGGS FOR HATCHING**. By reason of the great **VITALITY** of Hollywood Farm Stock and our method of packing their eggs for shipment, we **GUARANTEE** 90 per cent fertility, covering all shipments made by us.

IT IS A FACT, Reader, that the world's-record highest individual Leghorn layer—336 eggs—not only was hatched from Hollywood pen-sisters with trapnest records of only 250-259 eggs, but it also is true, absolutely, that ANY CUSTOMER of our Farm that season for Hatching Eggs might have received that identical egg in a low-cost setting! Such chances occur frequently in cases where there are years of rigid, selective breeding immediately back of these moderate-yield but highly vigorous specimens.

ALSO IT IS A FACT that from our record-breaking Hollywood Pen No. 5 that produced **TWELVE** 300-eggers and better in **ONE SEASON** and the **ENTIRE** number of pullets from which that were trapped **AVERAGED TO LAY** 255 47/74 eggs in 365 days—that **FROM THIS** unequalled mating of high-producers we sold fully one-half the eggs, **FOR HATCHING**, doing this throughout the breeding season and sold them at live-and-let-live prices. Following are our 1922 prices for hatching eggs, with the records of the birds that are producing them:

200 to 229 Eggs by Males from 250-259 Egg Dam.....	\$5.00 per 15	\$25.00 per 100
230 to 239 Eggs by Males from 260-269 Egg Dam.....	7.50 per 15	35.00 per 100
240 to 249 Eggs by Males from 260-269 Egg Dam.....	10.00 per 15	50.00 per 100
250 to 259 Eggs by Males from 275-279 Egg Dam.....	12.50 per 15	70.00 per 100
260 to 269 Eggs by Males from 283-290 Egg Dam.....	15.00 per 15	
270 to 279 Eggs by Males from 283-290 Egg Dam.....	20.00 per 15	
280 to 289 Eggs by Males from 298-304 Egg Dam.....	25.00 per 15	

Fifteen eggs to a setting. Ninety per cent fertility guaranteed. (Cannot accept further orders for any grade in 1,000 lots.) We ask 20 per cent payment with orders for deferred shipment; balance before shipment. You can order with safety direct from this advertisement, provided you do not delay.

BREEDING STOCK AND LAYERS FOR SALE—We have for sale the finest lot of Breeding Cocks, Cockerels, Hens, Pullets and Mated Pens ever offered to the American public. All of them are closely related to our many contest winners in all sections of the United States, dating back over a period of six years.

Green Feed Always For Florida Hens

Big profits in poultry farming come when there is required a minimum outlay for upkeep.

Florida's mild climate eliminates expensive housing and heating and furnishes green feed at all seasons.

Poultry farming in Florida is not a speculation but a profitable investment that provides income all the year round.

You can start on as little as one thousand dollars with assurance of success. We will sell you the land for a poultry farm on liberal terms.

Our free booklet will interest you.

The Dinsmore Company
416-B Graham Building
Jacksonville, Florida

That is why, when some men speak glibly of trapnest records, old breeders shake their heads. It is almost beyond the range of human effort for a man operating a one-man poultry plant to actually trap his birds. He may do it for three months. That is quite a spell. If you think not, try it. You will soon shift the job to your wife. She will hang to it longer than you did, but she, too, is not a human machine.

For this reason, a system measuring of a hen's ability to produce eggs, the measure of a year being based on a short period, of actual trapnesting, would be a system worth looking into. C. T. Patterson purports to have such a system, and describes it as follows:

"One of the most important problems confronting a poultry breeder is how to measure a hen's ability to perform. The time measure commonly used is one year, but everyone who has studied the life's production of a number of hens, recognizes the fact that one year as a measure is a very poor index of what the hen's real ability is.

"A hen will produce 203 eggs one year, 79 eggs the next, and 103 the next, etc. This variation is evidence that one year's record is not a true measure of production.

"Nature has fixed a law for maximum egg production at an egg per day and this law or rule is not violated one time in 100. The minimum, or opposite to the law, is no egg production.

"A hen can and will produce eggs according to her ability less the handicaps. She may have ability to produce 300 eggs in one year, but handicaps may be such that she does produce only 150 eggs. The standard so often used of one year is defective because of no measure being made of these handicaps, such as weather, feed, lights, crowding, etc. The best period to use for measuring performance is a period long enough to determine any characters the hens have which influence egg production, such as broodiness, putting on or taking off fat, or the failure of any organs to hold up under heavy egg production. To take a longer period than this would permit the handicaps to enter and make the measure of less value. We find 100 days to be the best time measure known. A shorter period than this may not show all the hen's weaknesses, yet a longer period than this will permit the influence of too many handicaps.

"The 100 days must be left to the hen to select, for man cannot fix an arbitrary date to measure production. The way to let the hen select the date is to trapnest her for at least six months, including the spring season, and take the 100 consecutive days of highest production. In this way, the hen shows her ability when handicaps are least.

"This gives a clear idea of the hen's ability to perform. If she produces 80 eggs during this 100 days, she is an 80 per cent hen, while if she produced 140 eggs in one year, that is all we know, for under less handicaps she might have produced 240 eggs in one year.

"From the year's record, we only know the hen produced so many eggs, but know very little of her relative producing ability. I have before me the record of a hen recorded by one of the best universities in the United States. The first year she laid 66 eggs, the second 154, the third 139, and the fourth 133, her best percent was 77, which indicates that she was never up to her full production for any one year. The first year as an index indicates her a cull, but the fourth year a good hen.

"In getting the length of time required for the molt, we averaged a large number of hens and found the time to be so close to 65 days that we give 65 days for the molt and 300 days to egg production. Therefore, we consider the hen which lays 300 eggs in 300 days a perfect hen, but this time, as stated before, is too long, as it permits the influence of handicaps, so we use 100 days, which is better.

"If a hen lays 100 eggs in 100 days, she is a 100 per cent hen; if she lays 90 eggs in 100 days she is a 90 per cent hen, and to get the year's producing ability, multiply this percent by three. The 90 per cent hen has a year's producing ability of 270 eggs.

"Some have failed to properly understand this one point, which is a valuable one: The per cent shows the production, or what the hen has actually done, while the year's producing ability is shown by the per cent multiplied by three. Thus you will see the per cent has a double value of showing actual

Light and Dark Brown LEGHORNS

Buy some of my choice Single Comb Brown Leghorn eggs for hatching and raise some winners and layers. Price of eggs from mated yards are \$2.00 to \$10.00 for 15, and from range flock \$1.50 for 15, and \$8.00 for 100. My strain originated mostly from Tormohens and Grove Hill's best birds and are surely fine. Baby chicks for sale also. John W. Moore, R. F. D. No. 1, Dent, Mo., Poplar Bluff, Mo.

BRED-TO-LAY SINGLE COMB White Leghorns EXCLUSIVELY

Hatching Eggs from big winter layers mated with pedigreed males whose dams laid 270 to 280 eggs in a year. Write us at once and arrange for your hatching eggs to insure delivery when you want them. Prices reasonable. Silver Grove Poultry Farm, R. R. No. 1, Marion, Ind.

production, and also telling the hen's ability to produce.

"Someone may say, 'here is a hen which has actually produced more than 300 eggs in one year, and her per cent is only 95, which shows an ability to produce 285, what about her?' Yes, we find such hens, but they usually borrow from one year for the other. She did it in 12 months without a molt so she could not make the same record the next year. Therefore, the per cent is better than the year's record. The year's record will mislead the breeder far more than the per cent.

"An arbitrary date fixed by man as an index is not a good guide, whether it be one year as an index, or whether it be some other time. The hen, by her performance, should select the time, and 100 days is the best.

"Continuous trapnesting is the work of experiment stations, agricultural colleges, etc. Such work is what they are supported for and it is from their records that we are able to solve many of the problems which would not be solved, were they left for the individual breeder.

"Farm flock averages under different conditions should not be used to set standards of production, either for breeds or varieties, or fixing measures of production."

Specialty Club Standards.

By John Miller.

The movement which is advocating the issuance of Club Standards by specialty poultry clubs is receiving a great deal of encouragement, especially from certain quarters, whereas it should have been stopped at the very beginning.

Those who are backing the proposition are making the plea that the issuance and free distribution of club standards will greatly increase the number of poultry breeders, which plea is nothing but "bunk." A man who is not sufficiently interested in good poultry to pay a reasonable price for a real worth while standard, especially when the money he spends for the standard will be used to promote the poultry industry, cannot be converted into a fancier merely by making him a present of a cheap so-called standard.

The only thing that will be accomplished by issuing club standards will be the depriving of the American Poultry Association of a great deal of its legitimate revenue and the creating of a chaotic condition in the poultry industry.

If a mere handful of men can issue a standard in opposition to the present Standard of Perfection, there is nothing to prevent any man who so desires from doing the same thing. And if every breeder is to bring out a standard setting forth his ideas as to what constitutes a perfect bird it will be only a matter of time until there will be no standard-bred fowls, for there will be as many different standards as there are different breeders, each standard calling for a different type of bird.

This agitation for specialty club standards should be ended for all time, and one of the effective ways to do it might be for the American Poultry Association to refuse to further recognize breeds that are represented by clubs that publish standards.

The present Standard of Perfection is the supreme law in the poultry world, and now is the proper time to demonstrate that fact.

Feeding the Layers.

I have studied carefully the article by Harry G. Forster, "The Cost of Operating a Poultry Farm." Every item is perfectly O.K. with one exception, that is, the cost of feed for layers. He bases that at \$1.75 per bird. My birds eat about 18 lbs. scratch feed and about 12 lbs. laying mash per 100 birds per day, and I am paying \$2.70 per 100 lbs. for scratch and \$3.20 per 100 lbs. for laying meal. This will figure out at much more than \$1.75 per bird per year. I realize that feed may be high here; anyway, I would very much like to hear from Mr. Forster and get some more details.

Ont.

Chas. H. Parsons.

Barred Rocks as Layers.

In the third Canadian egg laying contest, the Barred Rocks again stand out as the chief contributors in egg production. The best scores made during the fourteenth week of the contest show two pens of Barred Rocks at full working strength. The best individual record to date is held by a Barred Rock. At this point, fourteenth week, 241 birds of different kinds have failed to give a good account, and 55 of this number have totally blank records to date.

Pure Dried Buttermilk

Volume 1

CHICAGO, MARCH 1, 1922

6

FREE To Poultry Raisers FREE

The P. D. B. News is a monthly publication for the poultry raisers of America.

It tells how to profitably feed Pure Dried Buttermilk to poultry, and contains much valuable information.

Feeding formulas are published. Experiences of practical poultry raisers are exchanged.

Two-year tests completed recently by Purdue Agricultural Experiment Station showed that Dried Buttermilk increased the egg yield 235 per cent.

Dried Buttermilk increases the fertility of eggs and is "Nature's Own Food" for baby chicks. This statement is backed up by many unsolicited testimonials from users and from the country's best poultry authorities.

P. D. B. is the solids in pure creamery buttermilk, with nothing but the water removed.

P. D. B. cuts out mortality of baby chicks and produces the early maturity necessary for maximum profit.

Answer these three questions and get a year's subscription to The P. D. B. News free:

How many chickens do you own?

What is your feed dealer's name?

What is your own name and address?

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles may be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

Establishing a Poultry Plant.

First Prize Article.

Will just write a few lines to give you my experience in raising poultry here in Vermont.

Although Vermont has its drawbacks there are several small commercial plants, keeping from 500 to 1,500 layers.

The biggest drawback that I find is the long, cold winter nights. It is also quite a distance from market, although the cities of Massachusetts, such as Boston, Springfield, Lawrence and others are easily reached by express.

Now as to my experience, I am only young in the business, really only starting this last spring. But ever since I was twelve or fourteen years old my brother and I have had a few hens of our own. As we were quite successful with them and I liked to watch and care for them I became interested in them and decided to go into poultry on a large scale some day.

After graduating from the Vermont State School of Agriculture in 1918 and working a year or two I decided to take a course in poultry raising. So in the fall of 1919 I went to Cornell University and took their twelve weeks short course.

I found out there that there was more to learn about poultry than anyone would think of. After completing my course there I went to work on a plant in New Jersey. I worked there during the spring and summer and in the fall I decided to come home and start in for myself.

So the first of September, 1920, I started in. I bought some lumber and started building some colony houses.

These I built on runners with a double floor with building paper between. They have four windows, one on each end and two in front, which is to the south. The walls and roof are covered with roofing paper.

I built five of these 8x10 and bought one 10x12 ft. making six in all.

I then bought three Colony brooder coal stoves. Then I began to read the advertisements for some day old chicks. I finally placed an order for 1,500 S. C. White Leghorns. These came in two hatches. The first hatch March 15th, were from trapnested stock; the second hatch came May 15th and they were also from egg-bred pens. In addition I hatched over a hundred of my own, so I had a total of 1675.

For feed I gave commercial chick feed for scratch grains; a mash composed of 200 lbs. bran, 100 lbs. brown middlings, 100 lbs. corn meal, 80 lbs. ground oats, 100 lbs. meat scraps and three-fourths per cent salt. This was fed dry at noons until they were six or eight weeks old, then they had it before them at all times.

Baby Chicks

Sturdier chicks than we distribute are not produced. Standardbred chicks, produced according to

natural laws, are chicks from which results may be expected.

We specialize in the following varieties and guarantee safe delivery at the quoted prices per 100:

Barred Plymouth Rock.....	15.00
S. C. White Leghorn.....	\$13.00
S. C. Brown Leghorn.....	13.00
S. C. Rhode Island Red.....	15.00
R. C. Rhode Island Red.....	15.00
White Wyandotte.....	16.00
Silver Laced Wyandotte.....	16.00

Our catalog containing many interesting suggestions on chick production and chick culture, will be promptly mailed upon request. Write for it.

CHAS. KIRCHNER

304 S. 6th St., MARSHALL, ILL.

I also fed semi-solid buttermilk until they were eight weeks old. Water, grit and charcoal were always before them. They also had chopped up beets until the ground was so they could go out and get grass.

I gave them the best care I could and tried to see that they lacked nothing they needed and believe I was well paid for my work for I raised 75 per cent of them.

I sold my roosters as broilers, shipping them to Boston to a commission house. Before I go any further with this account of my chickens, I will tell what I had been doing for a laying house.

During the winter I worked for one of my neighbors and cut 13,000 feet of spruce and hemlock. I had drawn my own plans for a laying house and had this lumber sawed so as to waste as little as possible. As soon as the frost was out of the ground in the spring I started my foundation. My house was to be 25x90 ft. I dug a ditch 2½ feet deep and a foot wide and filled it with stone on which to lay the wall. I also covered the ground inside with a layer of stone. I bought a small cement mixer and put up a wall a foot high and six inches wide. For the floor I put on two inches of concrete, then some tar felt paper and then another inch of concrete. This paper acted as a dead air space, stopping the cold and dampness.

On this foundation I built a shed roof house, five feet high in back and ten in front. The entire roof and walls were covered with roofing paper.

The first ten feet of this house I used as a feed room. The other eighty was divided into pens by three half way partitions. These serve to break any drafts that might be in the house. The other half is not fenced off so the hens have the whole run of the house.

The nests are built on these partitions, the mash hoppers and shell hoppers under the windows at the front and roosts and dropping boards at the back. Water stands are in the middle of each pen.

For summer ventilation I have a door in front and back up under the rafters, which lets all the hot air out. In order to prevent drafts on the birds I double boarded the back of the house down on the studs and up on the rafters so the cold air coming in passes under the dropping boards or up by the rafters over the hens and out.

In front, which faces the south, I have fourteen windows, half of which are cheese cloth curtains which always keeps the house ventilated and dry.

Now to go back to my pullets. I got my first egg August 1st, when they were just 4½ months old. As soon as I got my laying house done I moved them into it. They layed well until about the first of November, when I found I had hatched them too early for about half of them went into a partial molt.

About that time my father and I bought an electric light plant and I started lights on them, giving them a fourteen hour day. For feed I give them commercial scratch and a mash, composed of 100 bran, 100 brown middlings, 100 cornmeal, 100 meat scraps, 80 ground oats, 2 per cent charcoal and three-fourths per cent salt. Water,

H. V. Tormohlen Box 2 Portland, Ind.

S.C. ANCONAS R.C.

Our combination Official Egg Laying Contest and Exhibition matings are producing very fertile, hatchable eggs and vigorous chicks. They are trapnested and under Record of Performance tests, being monthly inspected by Government Agriculture Officials. These matings contain many valuable birds that will reproduce a fine line of heavy winter laying females and fine exhibition birds, and investment in chicks or eggs will bring pleasing results. Many prominent breeders, males and females, have our rich blood lines. It is many times said our blood lines have put the typical Ancona finish and great egg producing qualities, the TWO IN ONE that the best Anconas now have. Will have only a few SPECIAL matings, and the eggs and chicks will be limited. If you want the very best in Anconas do not pass up this chance to get them at our very reasonable prices. We feel sure our customers' and our own success the coming year from these matings will force you to pay much larger prices for eggs from the same matings the following year. Price list and circular free. A square deal guaranteed.

grit and oyster shells as well as dry mash always before them. They also have mangels beets every noon.

I am using my lights in the morning as it is most convenient for me, however, I think the evening lunch plan is the best if it can be worked.

I try to do all my work just as regular as possible and make as few changes as possible.

After starting the lights, I was getting by the middle of December, 150 eggs a day, out of 600 S. C. White Leghorn pullets, which I think is fair. They are increasing every day and in January they gave a 40 to 50 per cent yield.

I am very strong for Leghorns. I believe they are the only thing for a commercial plant. At present am shipping my eggs to commission houses in Boston but hope to secure some private trade.

I hope in time to develop my plant to 2,000 or 3,000 layers and do trapnesting work and sell foundation stock, chicks and hatching eggs.

In closing will say that visitors are always welcome, because in having them you get a certain amount of advertising and if they are poultry raisers themselves, you can generally learn something from them.

Vt. O. C. Chadwick

A Success on Small Capital.

Second Prize Article

In the spring of 1919 we purchased a small farm of twenty-four acres and took possession in the month of March, at which time we acquired seventeen old hens of every imaginable kind and color. We were so much in debt on the farm that we had no money to purchase equipment but managed to buy eggs to set every hen we could persuade to set, and later a friend loaned us an incubator, but all our chickens were late hatched. Not having had experience with incubator chicks, and having only home-made equipment, we did not save a great per cent of them but when fall came we had one hundred lovely R. I. Red pullets, and three fine cockerels, hatched from a setting of eggs bought for that purpose. We spent \$20 for hatching eggs that first season. Our pullets began laying early in the winter and soon paid for their feed, eggs purchased, etc.

The poultry house was in bad condition even after my husband had spent several hours and used a great deal of old material found on the place in making it better. Also it was not large enough, so we converted an old granary and shed into another poultry house and took the seventeen old hens and the culls from the one hundred we raised and placed them in this house, leaving the seventy best pullets and cockerels in the original coop. We secured our hatching eggs from these seventy good birds and though they were pullets, we had fine success. After the laying season we sold the old hens. We raised one hundred twenty pullets that year and the problem of a place to keep them again gave us an idea. We converted a driveway between the barn and corn crib into a poultry house.

My husband used old scraps of material found about the place and worked many evenings till ten o'clock getting this shed ready for the best

MEYERSDALE, PA.

Three effective implements in one

There's undoubted economy in buying this Planet Jr. No. 25 combined seeder, double and single wheel hoe. It includes every advantage of these three separate implements—an accurate seeder, a double wheel hoe for hoeing both sides of a row at once—and an efficient single wheel cultivator for 'tween rows. In every particular a Planet Jr. product—accurate and durable, simple to operate, thoroughly dependable.

This and the full line of famous Planet Jr. seeders, wheel hoes, one-horse and riding cultivators are shown in the complete Planet Jr. catalog. Send for your copy today.

No. 25

one hundred pullets.

We had fine success with them and astonished many farmers who thought we were amateurs. We keep them housed during all the cold weather and feed a mash of commercial feed mixed with sour milk on Monday and Thursday mornings; wheat on Wednesday and Sunday mornings; and soaked oats the remaining mornings.

We fed corn in the evenings and kept a mash in home made self-feeders about two feet off of the floor. It was composed of 100 lbs. bran, 100 lbs. middlings, 100 lbs. corn meal, 100 lbs. ground oats, 50 lbs. gluten meal, 75 lbs. beef scraps, 25 lbs. O. P. oil meal, 5 lbs. powdered charcoal and 5 lbs. fine salt. Birds have excess to this mash all the time.

We keep the water and grit about two feet from the floor so that they may get more exercise. We never allow the birds excess to the roosts in the day time.

We have three cows and the hens get the excess sour milk.

Last spring we sold many eggs for incubation, besides hatching about 500 for ourselves. We raised about 230 pullets. With the 120 pullets, which were now hens, we had 350 hens and pullets for the winter.

Again we must have more house room so we made use of an old wood-house which is the last of the old buildings we can utilize. These chickens have paid for the original seventeen hens, for all feed we have ever fed them, a brooder stove purchased last spring and we now have a large supply of corn and oats paid for, so we really have nothing invested in poultry, yet they have paid over and above all this, about \$550 cash returns. And now we have an invoice of 350 hens and five full blood males.

We always sell the roosters as soon as they are large enough for broilers, while the price is high, instead of keeping them until fall. We are grading up our stock and our hens are becoming better each year.

In raising our incubator chicks we are careful not to get them too hot in the incubator, thus over heating after hatching. We let it cool to about 90 to 95 degrees by keeping lamp blaze low and ventilating with a small opening on the door, a few hours before removing the chicks from the incubator. Then we keep careful watch of the temperature in the brooder for the first three weeks, lowering it each week. We start them at 90 to 100 degrees, then 80 to 90 degrees, and then 70 to 80 degrees.

We give nothing but sour milk for their drink the first two weeks, then give milk and all the water they want. Their first meal, when they are about fifty hours old, consists of coarse sand and fine gravel. Then we feed five times a day, boiled eggs and cracker crumbs rolled fine, also rolled oats and steel cut oats. We are very careful not to feed too much.

After one week old we feed four times a day and finally three times. About this age we give cut grass, clover or dandelions and onions, also corn bread; and when ten days old begin giving them a dry mash composed of 10 lbs. wheat bran, 5 lbs. of ground oats, (sifted if ground with hulls) 5 lbs. middlings, 5 lbs. corn meal, 2 ounces each of fine charcoal

Royal White Wyandottes

20 Years of Constructive Breeding

No hen that has not produced over 200 eggs per year is used in my breeding pens. They are mated to cock birds and cockerels from the highest prize winning birds in the flock. Hatch your own heavy laying pullets and fine show birds from Royals in 1922

Eggs for Hatching

PURITAS SPRINGS S.C. WHITE LEGHORNS

Trapped for Over Ten Years Without Missing One Day. Every Nest on Our Farm Is a Trapnest
**THAT'S HOW WE PRODUCED THE WORLD'S GREATEST LAYERS
THEY CAN'T HELP BUT LAY**

Puritas Springs Leghorns have been trapped for so many years that they can't help but lay. You can feed a chicken any way you like and if it isn't bred to lay no amount of good feed and good care will make them lay. That is why we trapnest every day of every year. When you buy eggs, chicks or stock from Puritas Springs Poultry Farm you are getting the benefit of our many years of trapping, which means that you will then have the world's best layers. Send for our big free

instructive 1922 catalog. The many letters in our catalog from our customers prove that they can't be equalled for laying and they also have beauty combined. Our catalog also gives prices of eggs, chicks and stock, photos of our Leghorns and Farm, and much other information. Send for our catalog today, and order your chicks, eggs or stock. We can supply you with breeding males or females promptly. Can supply eggs or chicks any month you want delivery made, providing you order early. Can supply 8 to 12 weeks old pullets and cockerels any time after May 1st.

CLOSE-TO-NATURE
INCUBATORS

INCUBATORS

An Incubator Without a Fad or Flair
Solid, Substantial, Dependable

The old, well-known name, Close-To-Nature is a guarantee of a safe, sound, sensible incubator. Warm water heat, double walled construction, and large glass top that enables a view of the entire egg chamber. Made in five sizes from 60 eggs to 300 eggs.

Open Air Hovers and Brooders

Apply the three Close-To-Nature principles: Contact warmth, fresh air ventilation, no piling up or overcrowding. As natural as Nature itself. Write today for circulars, etc.

CLOSE-TO-NATURE CO., 38 Front St., Colfax, Ia.

and salt. We leave this in self-feeders before them only a short time in the afternoons, gradually letting them keep it longer, until they always have it before them in little mash boxes. When they are three weeks old we add 2 lbs. of meat scraps to the above formula. We have lost very few chicks. After they are two weeks old we gradually begin feeding wheat and cracked corn or any commercial scratch feed. I might add that we have used all the eggs and chickens we cared for during the period which is covered by the statement of profit which I have given.

Ind. Mrs. Fred Kurtz.

Case of the White Leghorns.

By A. F. ROLF,

Secretary, National S. C. White Leghorn Club.

In the course of a recent trip to one of our rural sections I ran across a good farmer, and our conversation soon ran to White Leghorns. Mr. Farmer acknowledged that prior to this time all chickens had looked alike to him, but that with the advent of the boll weevil, and consequent loss in cotton revenues, he and the good wife had become more alive to the possibilities of increasing their income from other sources.

In consultation with his county agent, and through the study of some poultry literature he obtained for them, they finally decided that White Leghorns presented a great opportunity. Previous experience with livestock, and general observation of the experiences of others, convinced them that if they were going to get some White Leghorns they wanted nothing but the best.

Here was a farmer who had been "sold" on the idea of purebred White Leghorns, and who had made up his mind to start right. But, here he confided, he had struck a snag. He purchased a poultry paper from the newsstand in his nearby town, and that night, the good wife and himself undertook a study of the advertisements in order to locate a source of supply.

Having a copy of that paper (January, 1922, issue, so thoroughly up-to-date) in his pocket, he undertook to show me what he ran up against. His story ran something like this:

"The wife's eyes being better than mine, she read the various advertisements to me, and we analyzed them together. Now here is the first White Leghorn advertisement which appears in this paper. It looked good to me, for one of the points stressed is the fact that this farm is 'the largest producers of high-classed, utility Leghorns east of the Mississippi River.' Also, that as regards the 'size of eggs—there is no other farm that can compete with us.' I was, however, a little puzzled at their description of American Leghorns as 'old-fashioned.'

"But turning the pages, we came to another advertisement which seemed to feature figures more than chickens. In this advertisement I found two claims that reminded me of claims used in connection with the sale of fake oil stocks, or other doubtful investments. See, here they are: 'You can make \$1,000 to \$2,000 annual profit by using a \$25.00, \$50.00 or \$100.00—cockerel to grade up your flock.' And, 'You can double your present income by stocking your farm or poultry plant with the — strain.' No mention, mark you, of the present quality of your flock, or the extent of your present income. 'Looks fishy to me,' remarked the wife, and I had nothing to add.

A Straight Draught Without Any Turns

Cantleak Chimney Flange

Patented August 17th, 1920

can be set up on any roof and it will give you straight draught, from your fire up thru your chimney, and a straight draught without any turns is what you want to keep a fire going properly.

Lord Farms, the inventors and manufacturers of the Cantleak Chimney Flange, have been experimenting for a number of years and at last have found the way to obtain a straight and steady draught for the coal burning brooders and mammoth incubators, or wherever a fire is used in an out building.

No wire stays to support chimney—easy to slip it into place and it will stay there. Takes less than two minutes to set up and take down. Write today for one and forget your chimney troubles.

F. P. C. CHICK MANNA

The same food elements nature demands for baby chicks, turkeys, pheasants; the seeds and insects the chick naturally seeks. Prevents bowel troubles.

Only finest quality cereals, animal foods, etc. No seconds. As carefully prepared as food for human babies. At dealers or write us. Satisfaction or money back.

F. P. CASSEL'S SON
Box 28, Lansdale, Pa.

"So, we decided to look further. Here, just a few pages farther on, we found some copy which sounded rather technical to us, especially such statements as that which said the breeding male is responsible for the amount 'and size' of eggs; that 'all the factors effecting egg yield in the germinal constitution are pure for high production (in the sire) consequently they can only transmit high production to their offspring'; further that 'these factors are also dominant over factors for low production, so that even though they may be mated with females that transmit low production the resulting female offspring will give high average production.' I don't know whether I understand all this, or not, but both the wife and myself figured that if this was true we didn't need to bother much, not even to get White Leghorns in their purity, but simply get one of these 'sires' and breed him to our 'just chickens' and we couldn't fail to get high average egg production. Simple, isn't it, after you know?"

"This same farm advertises, in bold display letters, 'The greatest of all laying strains.' Well, that is what the wife and I want, and we find further that this advertiser is offering, without qualification, 'the finest lot of Cocks, Cockerels, Hens, Pullets and Mated Pens ever offered to the American Public.' Well, we hoped this was true, for if so, we could end our search here. But, our curiosity being aroused now to almost fever pitch, we decided to make an evening of it and read further.

"The very next ad struck us as having an extremely doubtful statement in very prominent position—"The only absolutely free range

breeders of White Leghorns on the Pacific Coast." After all we had read, and heard about free range, and the great range flocks of the Petaluma and Northwest districts, it seemed queer to us that there should be but one breeder practising the method. But, then, this same flock claims to be a 'strain of 300-egg stock' and to have the first flock 'of two-year-old hens that are actual money-makers during the molting season.' Why, Lord bless you," exclaimed the farmer at this point, "I have neighbors whose word I will take as quickly as I will any person in the world, and they insist that they have made money from 'two-year-old hens' both in the molting season and out, for many years past.

"Wife and myself hastily turned away from this exposition of extravagant claims, but—what's the use. Just read the following clause for yourself, and which needs little comment, for the next prominent advertisement says, 'Every ——— egg that finds its way into your incubator or under the mother hen will send forth from its shell, a good sized, livable chick that will have inherent strength and vitality sufficient to enable its continuous growth and development.' Ye Gods and Little Fishes! What a secret this man must have unearthed. Absolutely no infertility, absolutely no mortality—nothing even said about any necessity of proper incubation conditions, intelligent feeding, or anything else—simply get 100 eggs and be assured of 100 livable chicks, without danger of loss at any time. But, then, about that time we noted that this breeder has 'The World's Best,' so we passed up his copy without further study.

"Next—after two or three ads which read

Science Discovers Greatest Lice Killer

**Changes Old Methods. No Dusting or Spraying.
Birds Delouse Themselves. Gives Lasting Relief.**

A recent discovery promises to revolutionize all the methods accepted up to now for keeping poultry free from lice and mites. This wonderful lice killer keeps the birds always lice free without the poultry raiser doing any work. It is the simplest, easiest, surest and best method ever discovered.

Credit for this marvelous discovery goes to Chas. M. Hick, a Chicago chemist. Mr. Hick is already favorably known to the poultry world as the inventor of the famous Hick's Egg-Lay Tablets that make the hens lay.

Hick's Licekiller which is the name of this sensational lice killer is a liquid that is added to the drinking water (or the feed can be soaked in a solution of it). The medicine taken into the system of the bird comes out through the pores and every louse or mite dies or leaves the body. It does not injure the flavor of the eggs or meat and is harmless. A few days treatment at the start and then a little in the drinking water one or two days a month.

So confident is Mr. Hick that this wonderful liquid will rid your flock of every louse or mite that he is offering every reader of this paper the opportunity of trying it out without any risk. Send no money, just your name and address to Chas. M. Hick & Co., 1018 So. Wabash Ave., Dept. 212, Chicago, Ill., and two full size \$1.00 bottles of this supreme lice remover will be sent you. Furthermore, as an exceptional offer, Mr. Hick will send you, at no additional cost, a regular \$1.00 box of Hick's Egg-Lay Tablets used by thousands of poultry men. On delivery deposit with the postman \$1.00 and postage. If after a two weeks trial you are not absolutely satisfied, write Mr. Hick and your money will be immediately refunded.

FIRST PRIZE YOUNG PEN BUFF ORPINGTONS NEW YORK STATE FAIR SEPT 1921.
BRED AND OWNED BY MAYSLAKE FARMS. HINSDALE, ILLINOIS.

Trio of Single Comb Anconas, which won first cock, first hen and first pullet at Madison Square Garden, New York City, 1922. Owned by H. Cecil Sheppard, Berea, Ohio.

very conservatively, and had a refreshing tendency after these strains on our imagination, we found an advertisement setting forth the merits of the flock that has 'produced the only two consecutive contest winners with over 300-egg official records.' Now, Alice is of an analytical turn of mind, and has a good memory, so she said, 'Wait a minute. Let's turn back to one of those ads we passed a few minutes ago.' Sure enough, she was right, there were the bald figures showing where a certain hen, owned by another breeder, had produced 312 eggs in one year at an Official Contest, and another hen, owned by the same breeder, which produced 313 eggs the following year at the same contest. Looks to me like these two advertisers better compare notes.

"Gosh! And yet again, Gosh! The very next advertiser is another who has 'The World's Greatest Laying Strain,' and 'the most prolific strain of poultry in America today.' Wonder how many greatest laying strains there are? For, on the very next page, we noted still another advertising 'The World's Best Layers.' And, in the next White Leghorn ad we could find, still another having 'the World's Greatest Layers.'

"But, soon we found a claim which took the cake. This remarkable ad extols some matings so good that 'I guarantee every setting of these eggs and every dozen of these chicks to produce a blue ribbon winner.' Still again, Gosh! There must be lots of blue ribbons hanging on the bushes and all that is necessary is to go out and pick 'em off! This offer is made by 'the world's largest poultry establishment' and it is East of the Mississippi River, too, although we had previously read about another 'largest establishment' east of the River.

"We quickly passed another ad regarding birds from which 'Results Are Certain,' and another ad which featured the fact that every bird they offered is 'toe-punched,' although we couldn't see how simply punching the toe would increase egg production or quality of the bird. But then, we had often been told that success in poultry production was dependent upon learning the simple, little things. Guess this is one of them.

"I thought, by that time, we had enough for one night. But no! Alice said, 'Wait a minute. Hubbie, I believe our old mongrel hens will lay at least as many eggs as the average hen in the U. S., and one of those bulletins we read last week placed that figure at 60 eggs per year. Now here, in this same paper, is an advertisement of some kind of miracle worker—an honest medicine, or tonic, which—'must double your egg production or your money back.' Now if we feed some of that dope to our mongrels, and double their production, we will get at least 120 eggs per year average. And now, on still another page, is the advertisement of an electric light accessory and equipment which will 'treble your egg yield.' No qualification or restriction as to what the egg yield may be—the outright statement that if one will 'set once daily—no other attention needed,' it will 'treble your egg yield.' Now after we get our mongrels up to 120 eggs by the use of the above dope, we will hitch up this outfit to our farm lighting plant, and, presto—treble 120 means 360 eggs per year average.'

"Now, who'd a'tho't it? Here we don't need any high-priced purebred stock at all, but by doping, and electrifying our mongrel hens, and by taking a course in higher mathematics, we ought to be able to write advertisements containing just as big figures as those we read about. Three hundred and sixty eggs; why, my gracious! that's more than any of these advertisers claim. Let's get busy, right now.

"But, seriously, Mr. Rolf, don't you think that some of your White Leghorn breeders might profitably learn about the 'truth in advertising' movement, and don't you think the poultry papers themselves ought to see what this kind of copy is going to do to them? It's bound to make the readers lose confidence—if they can't believe the advertisements, they will likewise look askance upon the reading columns.

A guide to success in this, the most difficult poultry problem

Know How to Turn Loss Into Profit

The results of many years of practical experience and study. Written by Prince T. Woods, a man who knows how and who can teach others. This book will save many dollars for any poultryman and is indispensable to the beginner.

Read These Chapter Titles Over

Chapter I—Selecting and Mating Breeding Stock. Chapter II—Food, Vegetable, Animal and Mineral. Chapter III—Fowls and Food. Chapter IV—Care and Management of Breeders. Chapter V—Eggs for Hatching. Chapter VI—Incubation, Natural and Artificial. Chapter VII—Brooding with Hens and with Brooders. Chapter VIII—Chick Foods and Feeding Chicks. Chapter IX—Growing Chicks. Chapter X—Facts About White Diarrhea. What white diarrhea is. Symptoms of disease. Causes. Is there more than one form? Has germ of specific disease been found? Infection. Prevention. Treatment. Formula for a simple remedy which has proved effective in many cases in many climates for years.

Don't go through years of costly and discouraging experiments to learn the facts taught in this book. One chick saved will pay for it. Learn how to feed; to prevent disease; to make your own brooders, and feed for your chicks. 75c postpaid.

Correct Type and Color of Rhode Island REDS

REMARKABLE BOOK "Blue Ribbon Reds"

Sent Free To Everybody
Who Mails Coupon Below

By means of the most remarkable set of Rhode Island Red illustrations ever produced, W. H. Card, secretary of the Rhode Island Red Club and the greatest living authority on REDS, in "BLUE RIBBON REDS," shows in a way so simple that every beginner can understand what constitutes the correct type and color of Rhode Island Reds. There are twelve drawings illustrating type and fourteen illustrating color. These drawings show the ideal Reds, both male and female, as well as the various shape and color defects most commonly found. Mr. Card also points out which defects are serious and which are of only minor importance.

Here are a few of the many subjects in
"Blue Ribbon Reds"

An A-B-C course in judging Rhode Island Reds
(In five lessons)

How Rhode Island Reds originated.

Mating Rhode Island Reds for Color and Shape.
How to obtain fast growth and large size on
Rhode Island Reds.

How to breed up an egg laying strain.

How to cull Rhode Island Reds.

How to prepare Rhode Island Reds for the Show
Room.

Which is the correct Rhode Island Red color.
Disqualifications.

Standard weights

Feeding Poultry at all ages

Linebreeding.

How to treat sick fowls.

How to get rid of lice and mites.

How to build poultry houses and equipment.

Special Illustrated Features

A picture of Rhode Island Reds in natural colors, suitable for framing, the latest and best ever published, copyrighted 1919. Pictures of many prize winning Reds at National Shows—Description of a common sense window for fresh air poultry houses and detailed illustrations made from blue prints—How to build a practical poultry house for a small flock of chickens—How to make a good home-made trapnest.

"Blue Ribbon Reds" is a veritable encyclopedia of useful poultry information. Cost \$3.00 to produce. You must see a copy of this book to appreciate its value. Mail the coupon. Enclose \$1.00. Get this remarkable book absolutely free with 3-year subscription to the

Rhode Island Red Journal

the official organ of the Rhode Island Red Club of America. Published monthly, at 50c per year. It is the "Red Breeders' Bible." Those

who know it say they would not be without it for \$5 per year. It keeps you in touch with all the leading breeders of Reds and keeps you posted on everything pertaining to Rhode Island Reds.

"Furthermore, although Alice and I retired about that time, and struggled with figures through a number of nightmares, we did, a few nights later, look through the same paper to see how the other breeds were advertised. Imagine our surprise to find an almost total absence of such extravagant, doubtful, or absurd claims in the copy relating to other breeds. It simply caused us to reach the conclusion that White Leghorns are so much greater 'wonder fowls' and the other breeds maintained by men who are totally blind to 'figures and profits'; or else, there are more d—liars breeding White Leghorns than one could imagine. Or, possibly, both factors may contribute to this condition.

"And so, although Alice and I still plan to install a flock of White Leghorns, you can bet your bottom dollar we are going to buy chickens, not figures, and we are going to place our business with some breeder who shows that he has due regard for truth and the future welfare of White Leghorns."

Thus ended the experience of this prospective beginner with White Leghorns. But, surely, his attitude and thoughts are worthy of serious consideration. Perhaps you have never studied the advertisements as closely as this—do so at once. You know what one thinks of the wild-eyed claims of oil-mining stocks, or similar doubtful enterprises. Are we going to let similar weaknesses in advertising put White Leghorns under the same sort of a suspicious cloud?

Unless we can bring about some change, and control over such copy, I can do no more than repeat the expression of my farmer friend—Gosh! Where do we go from here?

Score Card Judging.

I have noted with interest the argument advanced by D. J. Lambert, page 183, February Journal, for a simplified score card. I agree with his critics that when discussing score card judging as heretofore practiced, one is performing a post mortem on a long dead corpse.

But that is not the idea advanced by Mr. Lambert, and I believe that if a vote were taken among the amateur exhibitors of this country, as well as all others who are not able to follow their birds to the shows where they exhibit, that the vote would be unani-

mous for a simplified method, as suggested.

Thousands of persons send their birds to the shows each season. If each were in position to go with those birds there would be no great use for a card of any description. But the amateur will always be an amateur unless educated. He can get the desired information quicker by attending a good show or so each season than in any other way, but if he cannot be present, why cut him off entirely, with the excuse that such is his hard luck?

Give us the simplified card suggested. It will take two minutes of the judges' time to each bird. These cards will go back home to the fellow who could not attend in person. This is all he has to show for his efforts in trying to garner the ribbons. But with these cards he can see at a glance why he failed to get a ribbon and apply himself to overcoming the defect.

Do I hear it suggested that he should study the Standard, and in that manner be able to see the faults in his birds? Possibly so, but to have the living bird right before him with the judge telling him that the reason he failed to get a place was because that bird had purple barring; that the type was bad; that the legs were off in color; or thousands of other defects, will teach that person more than he could learn from a study of the Standard in a year.

And I am going to state frankly that it is sometimes necessary to have an explanation for any of us to follow the reasoning of the judges. This particularly applies to those judges who have advanced so far beyond the Standard until a bird that approximates Standard requirements has no chance of winning where they are placing the awards.

To illustrate my meaning: I attended a show this past season, and was looking over the Ancona exhibit. The fifth prize pullet was, in my judgment, the best Ancona in the aisle. Upon seeing the judge I told him that I had no interest in the awards, but wanted to get a little personal in asking some questions if he would promise to take it good naturedly. He readily consented—and lived up to it.

I began by asking him what was the chief defect that he saw in the fifth pullet, which caused her to be placed so low. He replied that she was too dark. I then asked him if she was not tipped rather close to standard specifications. He admitted that she was, but added that the new requirements would be every other feather tipped, and it took that to win in any first class show. The pullet that he placed first was equal to the other, possibly, with the exception that she was rather light. In fact the judge admitted that she was a little too profusely mottled, giving that washed out appearance at a short distance.

Now, I would like to know how the owner of that fifth prize pullet, who doubtless believed that he was sending an outstanding specimen to the show, was to know that the reason he did not win higher honors was because she conformed to the standard requirements, rather than to the judges' requirements? Had this judge been compelled to make out a simple card, he would have noted thereon that the bird was too dark, and this exhibitor would have known, at least, what he would have to do to win when exhibiting under this particular judge.

This is not the only instance that could be mentioned. I am sure that the Standard will be changed to conform to the great demand for more mottling, but because there will probably be a change in the future, should give no judge the right to declare a bird inferior now that conforms to the present requirements.

I admit frankly that I am among those who want to know the leaning of the judge before exhibiting. And I contend that it is essential to success when showing Anconas. The bird that has the tipping required by the Standard has absolutely no chance when numerous judges are hanging the ribbons, and on the contrary, some of the winners at the greatest shows in the country would not get a look in if they were to have the straight edge of the Standard of Perfection laid upon them.

I wish to close this with one more appeal for the amateur. Give him the simple card advocated by Mr. Lambert; let the judge fill it out; and have the show secretary forward it, showing the band number of the bird thereon, to the exhibitor. You will in this manner do more to educate the general run of exhibitors than can be accomplished in any other way.

S. C. G. G. McLaurin.

Failure With Poultry.

The Second Prize Letter in your February issue is another way of telling about the fellow who married a worthless wife and lived on cold beans, wearing socks without toe or heel and washing dishes while his wife read novels, ending up by committing suicide when she suddenly joined the angels. "What an alfred fool a man can be," and most of the chicken fanciers have been.

Doesn't our Texas friend know that he was just getting a few new wrinkles on his horns and that "His fate was the common fate of all"? For into all chicken raisers' lives some rain must fall and some days must be

dark and dreary. The ones that quit with such luck are the weaklings, they were never expected to succeed and are not qualified. That is the way our dross is consumed and our gold refined, and it is THE part of our education that is needed to change our minds from the idea that success comes to one easily and not from hard work. Genius is one part inspiration, and nine perspiration, same with poultry raising.

Your strawberry color comes from permitting your youngsters to pile up too deeply in the coops at night and sweating their color out. The best Red ancestors in the world will produce red, white and blue progeny if the youngsters are allowed to huddle up in close quarters at night. You do it and blame the breeder from which you got the eggs. That is one of his trials for which there is no relief, so I can offer him none, but you should humbly beg his pardon for thinking such a thing when your own work, or lack of it, is the cause.

You do not provide the right kind of roosting places for your growing stock; vide, the wry tails, they come from being forced to sleep all night in a corner. Your slipped wings, if you really have them, is caused largely by your forcing feeds. You say your birds have unlimited range in a good (mark that word good, and it in Texas) climate. Say, don't you know that if such were the case the bugs and other insects they are getting or should get is all the forcing feed they need? Was Jack Dempsey raised on candy and kept in a band-box? If your chicks have all nature demands, why over-egg the pudding and knock out their digestive apparatus by artificial propaganda? If you must use artificial methods as some of us must, then your feeds "nationally advertised" are a godsend and not a calamity.

There is evidently something wrong with your method of incubation or you would get a better percentage of hatch. We believe we got eggs from the same party and hatched 12 husky ones from one and 14 from another setting of eggs shipped to me by a breeder in Indiana, and I was given eggs for the ones that didn't hatch. Don't tell me that the Fanciers are not square. I've had too many dealings with them to think otherwise. They are the squarest sports and the gamest losers of any bunch I have ever played with and I long ago ceased to be a kid. Do you put earth in the bottom of your nests to help retain moisture? You surely need it if your climate is as dry as you say, and didn't your instructions that came with your hatching eggs tell you so to do? Mine did.

If you get seven eggs from 20 pullets your eggs should cost you less than a cent each unless your "overhead" is too much, and we most certainly think such is the case if you follow the feeding and sanitary program laid out in your letter. Cut out that green bone and excessive dipping; also your unskimmed Jersey milk, if it is of any value, if not cut out some of your high priced protein feeds. Your stock is getting a surfeit of it. Cut out all the frills and furbelows and raise your fancy chickens

WHITE DIARRHEA

A PERFECT HATCH! THEN WHAT?

Will you save every chick, or shall WHITE DIARRHEA get them... This contagious germ disease causes greater loss than all other poultry diseases combined. In infected flock the loss varies from 50 to 80 per cent of the chicks hatched. Chicks that recover often remain stunted all their lives.

Stop this enormous loss. Raise every chick you hatch. No need to lose a single one. Raise them all. Keep them healthy and strong and growing fast.

"Giles" POULTRY-TONE

is a safe and effective germicide for all bowel germ diseases. It combats the germs that cause white diarrhea and it tones up the system so the chicks can resist disease.

"Giles" POULTRY-TONE positively prevents White Diarrhea. For Chicks already affected, it affords prompt and permanent relief.

Send 20c for trial bottle. Enough to treat 12 chicks. Enough to prove its great efficiency. Larger bottle 50c; quart can, equals ten 50c bottles—\$2.50. Prepaid. Satisfaction guaranteed or money refunded. The season is here. Be prepared. Act now. Order today.

just the way to grow chickens. Use an old barrel as coop and put it in the shade of a tree. Let the chicks rustle largely for their living. Neither Ben. Franklin nor Abe Lincoln were reared in a king's palace. They don't grow men nor chickens that way, and beside it's too expensive for any one but Henry Ford or John D.

We cleared better than fifty dollars on a dozen hens in a back lot last year and hope to do better than that this year. But the first few years we did about as our Texas friend did. Experience keeps a dear school, but what is learned in her school is usually well learned. We hung to our chicks through our mistakes and now point with pride to our quick growing, early laying, beautiful colored and shapely pullets. Go thou and do likewise.

L. E. Rauch.

Correction.

An error appears on page 315 of this issue. The Standard Committee is called to meet in Chicago, March 14, not March 4.

Cost of Building a Plant.

About the wildest misstatement I ever read about the cost of poultry plant construction, etc., is contained in the article contributed to G. E. Stillwagon. The roofing material alone for a 10x14 house is 2,200 ft. board measure and 15 rolls roofing paper. If he puts in a concrete sill and has a dirt floor it will take 75 bags of cement to make a good job to frost line. If he had a living house and three acres of ground to buy and fence for Leghorn chicks, have all material given free and labor donated, it would still cost a beginner \$5,000 for stock, equipment, feed for year, etc., and a man has to eat while he is growing his pullets.

I have just completed a 120x16 ft. laying house and when water is put in and electric light and littercarrier, one could not buy many Christmas presents with the change from \$3,000, and that does not include ground. Long Island.

ALEX F. BARRAH.

St. Louis Show.

The poultry exhibition held in St. Louis, Mo., Dec. 29, 1921, to Jan. 2, 1922, was the largest and best attended poultry show ever held in the Coliseum building. The S. C. Reds formed a large class, with about 250 birds in competition. Some high-class birds were shown in Buff Rocks. S. C. Black Minorcas totaled 118. Some of the more ornamental varieties such as Hamburgs and Polish made a nice showing, and the bantams, Cochins and Games were strong.

Weather conditions were favorable and a splendid attendance passed by the box office.

Back Yard Record.

I have a pen of White Wyandottes, twelve pullets and one cockerel, hatched March 14, 1921. They started laying on September 2nd, the same year at the age of five months, two weeks and two days. In September, 1921, they laid 35 eggs, October 134, November 167, December 274, and in January, 1922, up to and including the 15th, 141.

We set a hen on January 9th which left only eleven pullets in the pen from that date until the 15th. As a matter of profit on back lot poultry we have sold over and above the eggs that we needed in the amount of \$39.28.

III.

A. D. Confelt.

Egg Circles.

Home demonstration workers realize that before substantial improvements can be made in rural home life there must be more cash income with which to install conveniences, correct defects, beautify the surroundings, or improve clothing. On most farms the production and selling of eggs and poultry offer the best immediate possibilities for increasing the income. The home demonstration agents of the United States Department of Agriculture and the State Agricultural Colleges, therefore, have turned their attention to giving help in this field whenever there seemed to be need of it.

PROF. HARE'S ECONOMY BROODER

will raise 'Em All

Buy or hatch chicks with assurance they will grow up and make you money.

You run no risk with the Economy Brooder. It is proof against accidents of all kinds and is soon paid for by the saving of chicks. Has fumeless, circular heater maintained at mother heat in center of hove around which chicks nestle comfortably; fireproof baby burner and large oil font; flame is seen and adjusted from the outside without touching heater; run is opened few inches for baby chicks, or extended. Built of wood and galvanized iron; nicely painted. Surpasses other small brooders for dependability, least attention, and low-cost operation. Size, 19 by 30 inches; 50 chicks.

Special Offer: Mailed by Insured Parcel Post (to hasten delivery) anywhere in U. S. for \$6.88; three or more, at \$6.54 each.

This big, standard 1,000 chick, coal-burning stove brooder, embodying all the latest ideas for rearing chicks in large colonies, sold at the lowest prices. SURE QUICK DEATH FOR RATS AND MICE

**Remarkable Triple Strength
Virus Kills Every One
Not A Poison**

Marvelous French Discovery

Rats are your enemies. They destroy your buildings, eat your grain, kill your poultry, start fires and spread disease in every community. You need no longer suffer these losses—You can now in a week's time, easily kill every rat, mouse or gopher with Rat Virus, the great French discovery. Our triple strength virus is the most powerful concentrated deadly virus known, the only sure, safe rodent destroyer.

Triple Strength Virus is absolutely safe to use anywhere—positively not a poison. No danger to chickens, horses, cattle, hogs or dogs. Harmless to children or grown persons. Affects only rodents.

Triple Strength Virus is prepared in a laboratory licensed and inspected by the U. S. Dept. of Agriculture. Triple Strength Virus is tested on rats, mice and gophers in this laboratory before shipment—it cannot fail.

Rats Die Outside

Triple Strength Rat Virus is easy to use. Simple directions show how. A single rat eating the virus gets sick with a contagious plague disease that affects and kills all rats and mice in the immediate vicinity. Rats flee because they become infected with a plague that affects the heart, blood vessels, and lungs, destroying the blood corpuscles and causing suffocation. The rats rush outside where they get fresh air and water. When the diseased rats get outside, they never get back for the disease is then so far gone it kills them. No odor, no dead rats to handle, no live rats to kill.

Special Introductory Offer

We want to prove to you our claim that Triple Strength Rat Virus is the most potent, most powerful—yet non-poisonous and absolutely safe—rat virus on the market. It is a TRIPLE STRENGTH Virus. Contains more living rat virus germs than any other rat killer made and will go one-third to one-half farther. To introduce this powerful Triple Strength Rat Virus, we will make every reader of this paper—for a short time only—a special offer of a regular \$2.50 bottle for only \$1.00 postpaid. This \$2.50 bottle Triple Strength Rat Virus is enough to clear a big poultry house, barn or yard of rats and mice.

Money Back Guarantee

Your money back if it fails. Take no chances this year with traps or rat poisons. Only Triple Strength Rat Virus will positively kill rats, mice and gophers and be absolutely safe and sure. Give it according to directions—if after 30 days' trial you find any rats or mice—we will refund your money without question. Send \$1 bill today sure.

If not convenient to send \$1 today—just send your name and address, a postal will do—pay postman \$1 and a few cents postage on arrival for regular \$2.50 bottle. Remember it costs you nothing if it does not do all we claim.

Agents Wanted in every community

The Good Old Breeds.

I am an Ancona man myself, and have absolutely no personal interest in either the R. I. Whites or the White Rocks, but notwithstanding, feel that I have a right to express an opinion.

I agree heartily with Mr. Vos that R. I. Whites, both Single and Rose Comb, should be admitted to the Standard. All well and good, but when he talks about "throwing the dead-wood out of the Standard," and dispossessing all the gold old-time breeds such as Javas, Dominiques, Buckeyes, White Langshans, Dorkings, Dark Brahmans, Red Caps, the French breeds, Spanish, and so forth, of their birthright, just because present day fanciers have not brains enough, or skill enough, or common sense and perception enough to take hold of them sufficiently to give them the popularity that they deserve, then I for one am going to pan him.

Stop and consider what this means. Depriving those certain good old reliable, although rare varieties, of their inalienable rights in the Standard, gained by them on the fact of them being the very foundation of the present purebred poultry industry of the United States; the first breeds of early poultry history to install the love of fancy fowls in the heart of man. To throw them by the wayside means the killing of those breeds, their destruction, ultimate extermination and extinction.

If you should remove a popular breed like Reds, Rocks, Wyandottes, Orpingtons, Leghorns, or Anconas from the Standard, they would be able to survive it, backed up by several thousands of energetic breeders, but the good old pioneer breeds are not in a position to withstand abandonment from the Standard.

They would succumb like snow before the rain. The few breeders who have stuck staunchly by them would desert them like rats from a sinking ship, in the face of a blow like that, and they would dwindle and soon be doomed.

I ask Mr. Vos, do we want to perpetrate a crime like that?

No. Let us hear no more of such talk, brother poultrymen. There is room enough and to spare in the Standard for all comers without the removal of any "dead-wood" that is not dead-wood and never can become dead-wood.

Let us have the R. I. Whites admitted, and any and all other deserving breeds, but let us have no more freaks or unestablished "crazy" breeds thrust upon us; and let us keep the good old timers also.

I believe that there is plenty of room in the Standard and that we should hold out the glad hand to all deserving, worthy new breeds.

With the way the industry is growing today there will be plenty of new fanciers to take care of both the new breeds and the old. I believe in more breeds and varieties of breeds and more poultry shows. And, most of all, it gives me pleasure to come to the defense of the good old breeds that have formed the cradle of the purebred poultry industry.

R. I. Charles R. Moxfield.

Our Cover.

The male illustrated on the front cover this month is a Silver Campine. The Campine is a Belgian breed. It has white ear lobes, practically black eyes, blue shanks, white skin and lays white-shelled eggs. Young Campines grow very rapidly. Their first strength seems to go largely to making growth, and they are, therefore, easily affected by lice and bad conditions. Under favorable conditions they outgrow almost any other breed. The birds are light eaters and enjoy a range. While capable of flying, they are an intelligent and tame chicken.

The neck of the male is silvery white. The barred sections are glossy-greenish black, and the more of this sheen the better; each feather is then marked across with a slightly V-shaped white bar. There is a tendency for some breeders to get this white bar too narrow. The barring in the male on the cover is about right. Notice should also be taken of his long back feathers over hips and sides of back. Skimpy feathered birds in this section lack the best quality. In type, this male is well proportioned and well balanced. He represents what the best quality in the country is actually like; and in this respect is a more satisfactory guide than the male pictured in the Standard of Perfection.

Let Us Fill the Idle Space in Your Garden with This Mammoth Fruit Collection

You can have Ripe Red Raspberries ninety days after planting! Big Melting Dewberries the next summer! And loads of Red, White and Blue Grapes, - and delicious Pears and Apples - in just a few years! Almost without cost to you! Read our liberal offer, and get this Mammoth Fruit Garden started NOW.

If you would enjoy having a Fruit Garden and Orchard like this, - Seventeen Trees, Vines and Berry Bushes, just plant this Mammoth Fruit Collection.

SELECTED FRUIT PLANTS

The Red Raspberry and the Dewberry plants in this collection have been selected from fields that have made high records for heavy production of quality fruit. By following the Instructions, you can secure new plants every year from these we send you, and extend your planting every season. The REX everbearing red raspberry will begin to bear in ninety days after planting, and continue until fall.

ONE SNOW APPLE

Deep red skin, almost black. Pure white flesh of peculiar rich flavor. Very sweet and juicy. Bears big crops at an early age. A Russian variety and very hardy.

ONE WEALTHY APPLE

Another favorite Russian variety. Yellow, overcast and streaked with red. Flesh is sweet, melting and tender, but slightly tart. Has few equals for every purpose.

APPLE AND PEAR TREE GRAFTS

These apple and pear tree grafts are produced by a method that insures every good quality. From bearing trees, the new branches ("scions") are cut and carefully grafted to a root of the same type. The fruit tree graft, thus complete, takes root as soon as planted, makes rapid growth, and in just a few years bears heavy crops of choice fruit. Each apple or pear tree graft is about a foot in length.

2 REX Everbearing Red Raspberry

A picking every week from June to October. The new canes bear first year, 90 days after planting. Berries large, firm, sweet, and of delightful flavor. A most dependable new fruit.

"CALLOUSED GRAPE CUTTINGS"

From selected vines in the best of the great Southern Michigan vineyards, cuttings about nine inches long are taken, and buried in damp, cool pits until they undergo a process called "callousing." The cuttings will then take root as soon as planted. The "Calloused Grape Cuttings" in this collection are all produced in this manner. They grow rapidly, make strong, healthy vines, and bear large crops.

ONE KIEFFER PEAR

Large, angular, and slightly irregular in shape, this old variety is the standard winter pear everywhere. Dark green. A splendid keeper, at its best in late winter.

2 Improved Lucretia Dewberry

Vines covered every summer with immense clusters of big, sweet berries. Rich, winey flavor. Very juicy. Individual fruits average 1 1/4 inch long and an inch through.

ONE BARTLETT PEAR

Yellow skin with red blush. Flesh sweet, juicy and spicy flavor. Very melon when ripe. Can be picked and eaten from the tree. Yields heavily, begins to bear early.

Satisfactory
Growth
Guaranteed!

3 DELAWARE GRAPE - Red

Large, well-shouldered, compact bunches of bright red, beautifully flavored grapes. Makes jelly or grape juice of finest flavor and aroma.

3 NIAGARA GRAPE - White -

Immense clusters of delicious, waxy-white grapes. Remarkably sweet and juicy. Good for wine, preserves or jelly. In flavor it much resembles the Concord. A prolific bearer.

3 CONCORD GRAPE - Blue -

The best blue or purple grape grown, and the universal favorite. More Concord are grown and sold every year than all other varieties, on account of its wonderful quality.

Complete, Illustrated Instructions for Planting

are wrapped in each package. They are fully illustrated with pictures and diagrams, showing just what to do, and how and when to do it. By following these simple directions you will have success.

60 Prizes Out of 60 Offered at Both Shows

Sweepstake Championship Male and Female and Every Special Prize—This is the crowning achievement of their unexampled record at New York for more than 30 victorious years. At the five Garden Shows—1917, 1918, 1919, 1920, 1921—THE IMPERIAL "RINGLET" won 27 First Prizes out of 27 offered.—Every Bird Bred on My Farm.

The competition at these shows was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

First Prize Sweepstakes Champion Cockerel
at Madison Square Garden, New York

Supreme at Madison Square Garden Is Supreme Everywhere

IMPERIAL "RINGLET" EGGS

During the past ten years the matings on my farm have done more to improve the Barred Rocks of America than all the other matings of the whole country combined.

You want eggs to produce the Silver Cup and Blue Ribbon winners for next season's shows. No other Barred Rock eggs have ever produced the extreme high quality birds as my Imperial "Ringlets." Hundreds of old customers order eggs every year—these eggs have brought them rich rewards in Silver Cups and First Prizes, and proved the foundation for many a money-making business.

My Imperial "Ringlet" eggs will place you in position to win at next season's shows. You may raise a single chick worth hundreds of dollars—hundreds of my customers have done this. **MY MATINGS ARE UNEQUALED IN AMERICA.** No such magnificent color and barring can be found on any living birds—as layers they stand pre-eminent.

My Eggs Are the Best Money Can Buy — They Produce First Prize Birds

Mr. E. B. Thompson, Amenia, New York.

Winchester, Indiana, January 3, 1922.

Dear Sir—I hatched 22 chicks out of the last "RINGLET" eggs you sent me and 12 chicks from the first eggs. I showed some of the older ones at our recent show and won First Prize on cockerel, First and Second on pullets, First on breeding pens and sweepstakes championship for the best male bird of any breed in the whole show.

Yours very truly,

W. O. HENDRICKSON.

Grand Exhibition and Breeding Birds for Sale of This Richest First Prize Sweepstakes New York Blood. Elegant Catalog Mailed Upon Request.

EGGS From the finest exhibition matings in the world. One set—\$20, two settings \$35, four settings \$60, 100 eggs \$90

AMERICAN POULTRY JOURNAL

VOL. 53

APRIL, 1922

NO. 4

Fifteen Cents Per Copy

Holterman's BARRIED

— Are Quick Maturing Birds. Two-thirds of all my own Aristocrats are hatched out between April 20th and

June 20th. The great prize winners in our largest national shows are usually hatched out in May or June.

With good care Aristocrats readily mature within six months time. Many, many reports are reaching me showing that the Aristocrats are fully matured and winning and laying *before they are five months old*.

Figure out for yourself where this will put your May and June hatched Aristocrat Chicks this Fall.

EGGS EGGS

Thousands of the greatest Show-birds the world has ever seen have been produced BY MY

CUSTOMERS, (please note these three words) out of Aristocrat Eggs directly from my yards. My Egg Booklet—which is free—contains overwhelming proof.

Aristocrat Customers are winning out in thousands of showrooms throughout the United

States and Canada. Winning out in the very biggest and best shows of all. These sensational records which my customers are making with their "Aristocrats" simply stand unsurpassed in the Annals of all Barred Rock History.

REMEMBER!
MAY and JUNE
Hatched Aristocrats are the
Cream of all Great
Showbirds.

NOTE: Most of these great Aristocrat Showbirds are hatched out in MAY and JUNE.

W. D. Holterman, Fancier

Aristocrat ROCKS

—Are at the Highest Point of Efficiency in April and May for Breeding Showbirds. Holterman's Aristocrat Barred Rock Eggs laid in April and May produce the finest Showbirds of all.

Aristocrat Chicks hatched out in May and June are richer in color of plumage and more narrow in barring than those hatched out earlier even tho they come from the very same matings.

This is a simple statement of a fact which is quite generally known to our best exhibitors.

EGGS EGGS

THE EGGS which are producing such truly grand prize-winning birds for my customers are \$15 for 15; \$25 for 30; \$40 for 50; \$75 for 100; \$300 for 500; and \$500 for 1,000.

A two-thirds hatch is guaranteed. It has become well known throughout North America that *Holterman is the man*

who is sending out the Real Quality in Barred Rock Eggs for Hatch-

Save yourself the trouble and disappointment of poor hatches by using

Buffalo Incubators

The machine that, because of their dependability, have become known as the "perfect hatcher." Whether you want a small or large capacity machine there is a BUFFALO that will exactly meet your requirements—furnished in 60, 120, 240 or 360 egg sizes.

The BUFFALO is the perfect hatcher because it has two things necessary to successful incubation—diffusive heat and correct ventilation, producing that mellow warmth found only in BUFFALO INCUBATORS. The constant and uniform heat in this "perfect" machine is accomplished by my patented sensitive and accurate regulator.

The BUFFALO is built of materials that insure years and years of service—it will not swell or warp out of shape—it is constructed under my personal supervision and built according to specifications that years of continued service have proven correct.

Chas. A. Cyphers

Mr. Louis Behrs of Cul-
lom, Ill., started with Buf-
falos and buys more every
year. His second-order this
season is for another Buffalo
coal burning Brooder Stove.

February, 1922.

Please ship another No. 2
Buffalo. I have been using
a large Buffalo for twelve
years and it is still giving
me the best hatches of all
I have run, which includes
about all on the market.
Frank C. Patten, Oneida,
N. Y.

The Buffalo "Never Out" Oil Burning Canopy Brooder

is Wickless—it burns kerosene, with a perfect blue flame. It is odorless—does not emit fumes or smoke—will not carbonize—will not overflow—will not go out as long as there is oil in the reservoir. Re-

quires the least possible attention and the cost of operation is very low. The BUFFALO "NEVER OUT" Burns Clean. Doesn't require cleaning while chicks freeze, because it doesn't carbonize. It is made of accurately machined castings, perfectly proportioned to produce complete combustion. Doesn't scale, warp, or soot up—just keeps burning like gas as long as it is supplied with oil. Is in a class by itself—you can depend on it day in and day out—you need never worry lest your chicks burn up or freeze—they are safe with a NEVER OUT.

Send your name and address and get free catalog describing in detail the many superior features of BUFFALO equipment. You'll find this season a profitable one if you decide to Hatch 'Em and Rear 'Em with BUFFALO equipment.

BUFFALO INCUBATOR COMPANY

BYERS' ORPINGTONS

At Chicago Coliseum Past 39 Months

76 of my Orpingtons stood under First Prize Ribbons; 117 of my Orpingtons stood under other Ribbons; 193 of my Orpingtons stood under ribbons; I won 13 out of a possible 16 Firsts on Pens; I have never lost but one Special for Best Display in Buffs, in Whites or in Blacks at this premier Exhibition—Chicago Coliseum, in past 39 Months.

Campbell Soup Farm was my chief competitor in Buff Orpingtons at the Chicago Coliseum Show December, 1921. The above Farm also showed and won at New York in January, 1922. At the Chicago Coliseum Show I won more points against this Farm than all other Buff Orpington exhibitors at this Show combined. And I won more points against this Farm at Chicago Coliseum than any of their competitors won against them at New York. I am the only Breeder in

If you would own this kind, buy into the Strain that produces them.

all America who won First Male against this Farm at either the Chicago Coliseum or New York Shows the past winter. Campbell Soup Farm will not sell a bird or an egg, and, therefore, extend absolutely no service as sellers of Buff Orpingtons, and are not competitors in the business field. My winning against this Farm decidedly excels that of any other breeder of Buff Orpingtons in North America at these two Premier Exhibitions. Just bear that in mind when considering any and all of the winnings of my advertising competitors. Remember also that birds that win easily at other shows seldom place at the great Chicago Coliseum and New York Shows. This accounts for so-called "sensational" winnings at other shows in weaker classes.

Last year purchasers of my Champion Exhibition Mating Eggs won at Madison Square Garden, at State Shows and elsewhere from Coast to Coast. Thousands of these customers everywhere have voluntarily testified in gratifying terms as to the genuine superiority of my Strain over all others, both as superior layers and superior show birds in their hands. Through cautious line-breeding I shall perpetuate these sterling qualities. Twenty years of exclusive and doubly successful Orpington breeding unfolds the reason.

EGGS

From CHAMPION EXHIBITION MATINGS, \$15 per 15; \$28 per 30; \$45 per 50; \$85 per 100. (Note this: If you are not satisfied next winter with this investment I will then send you a bird or birds free of a value equal to your entire outlay in these finest eggs). From Special Matings of Champion Blood, \$5 per 15; \$9 per 30; \$14 per 50; \$25 per 100. All eggs shipped prepaid and all infertile eggs replaced free. Mating list ready.

Jersey Black Giants

At Madison Square Garden, 1922

in biggest classes ever shown, Marcy Farms won 29 regular and many special prizes on single comb and pea comb Giants. At Newark—the Club Meet—we won 14 regular prizes and many specials on single combs. This proves we have the world's greatest flock of this wonderful breed. Circular and price list FREE. Catalog with illustrations and full description of the breed, 10 cents in silver.

MARCY FARMS, Box A, Matawan, New Jersey

INDEX TO GUARANTEED ADVERTISERS

We believe that every display advertisement in this issue is signed by trustworthy people, and to prove our faith we guarantee our subscribers against loss due to fraudulent misrepresentation in any advertisement of the following advertisers, appearing in this issue of American Poultry Journal. All we ask is that, in ordering the goods or goods, you mention to the advertiser that you saw the ad in American Poultry Journal; also that the purchase be made during the month or months in which the ad is inserted, and in case of loss notify us of the fraudulent misrepresentation of the advertiser, giving us full particulars as soon as it occurs. This guarantee applies to all subscribers who are on our unexpired subscription list who mention American Poultry Journal when answering advertisements.

Wilburtha White Rocks LAY and WIN

One of the first hens to lay over 300 eggs in one year at any official egg-laying contest, was our White Rock hen "Prolific Queen." She is now six years old and her blood flows in hundreds of our birds. They LAY! At the last Madison Square Garden Show, Wilburtha White Rocks won best display, winning 60 points to our nearest competitors 36 points. They WIN!

Write for our mating list—free—that describes our breeding pens in detail.

Hatches Now Mean Midsummer Profits and Fall Layers

Harry Johnson
The
Incubator
Man

My Old Trusty is still as good as new. This will be its thirteenth year.

Mrs. Clay Speck,
Wooster, O.

I have used Old Trusty 12 years. Always a good hatch.

Mrs. Chase Groat,
Madison, Kans.

Less Work and Worry When Old Trusty Does the Hatching

Don't let the first warm days of spring lead you to believe that you can get through the season without a good incubator. One Old Trusty a-going steadily is worth a whole poultry house full of setting hens and the cost is less in time and work. Now is the time to get your Old Trusty, and I am in a position to ship it to you quickly, freight or express prepaid the minute you say the word. And I am making a special offer too, which you cannot afford to overlook.

Send Me Your Name Today and Get My Offer

Hatches in Old Trusty now mean a yardful of laying hens next fall. Old Trusty puts certainty into your hatching. Keep your hens alaying while Old Trusty hatches out the chicks. With Old Trusty you don't have to worry about whether the hens are on the nest, and you are not kept running all over the place looking for new hiding places for broody hens sitting on only two or three eggs. As long as you raise poultry why not make money on it? Old Trusty more than pays its cost with the first hatch and keeps on piling up profits for you for ever after.

Reduced Prices—Quick Shipment

No one can build a better incubator than Old Trusty and no one can quote so low a direct-to-you-from-factory price as I can give you. Old Trusty is built in the world's largest exclusive incubator and brooder factory, where we deliver good work at low cost. Built with pure copper hot water heating system, California Redwood case, triple walls on all sides, top and bottom, and easy sliding, substantial egg trays. Nearly a million owners. Made in four handy sizes. Quick shipment from factory at Clay Center, or warehouse at St. Joseph, Mo.

Write today for our money saving offer and my helpful Old Trusty catalog. Yours truly, Harry Johnson, "Incubator Man". Ask for Catalog 25-V.

M. M. Johnson Co.

Clay Center, Neb.

Old Trusty

Incubators and Brooders

Think how many hens and how much trouble it would take to hatch as many chicks as a 150-egg Old Trusty.

When you hatch with Old Trusty you don't have any hens letting the eggs get cold or layers piling in and breaking up eggs and killing chicks.

H. H.

Johnson

Wyckoff's S. C. White Leghorns

AMERICA'S BUSINESS HEN

Remember that we are the originators, and for over 40 years specialty breeders of the justly celebrated WYCKOFF STRAIN of S. C. White Leghorns, the most prolific strain of poultry in America today. Place your orders at headquarters and make no mistake.

SPECIAL ATTENTION is directed to the fact that, almost without exception, the most successful Leghorn egg farms in the country, and those making the highest records at the greatest laying competitions in the world have been proven to be of Wyckoff foundation.

EGGS FOR HATCHING

from the most carefully selected matings. Our breeding matings for 1922 are made up with the most exceptional lot of carefully selected stock in the country, barring none. Every egg furnished will be from a grand lot of special selected birds, representing our highest quality stock in every particular. For size, strength, vigor and laying qualities, together with the true Leghorn type, they are unequaled. POSITIVELY NO SECOND GRADE OR IMMATURE BIRDS MATED, AND NO ORDERS FILLED WITH EGGS FROM "FARMED-OUT" STOCK OR OTHER BOUGHT UP JUNK. WE ARE BREEDERS, NOT HUCKSTERS. Place your order for some of the eggs from this famous high grade stock, and get in line with the most profitable era ever known in the poultry business. Send for free catalog giving prices and descriptions, with numerous photographic illustrations showing type of the birds and sections of this most completely equipped plant.

C. H. WYCKOFF & SON, Aurora, Cayuga County, New York

The Schwalge Sectional Incubator

"Four In One" 800-Egg Section

—the most practical machine for any poultryman, large or small. It has FOUR INDEPENDENT EGG CHAMBERS (of 200 egg capacity), each a complete incubator in itself. With this one section you can set FOUR different kinds of eggs at once or take off a hatch once a week as you choose. FOUR INCUBATORS IN ONE and HEATED BY ONE HEATER. Price \$138.00.

**Price

**The Schwalge
Fresh Air Brooder**

(Patent Pending)

Provides FRESH AIR BELOW THE HOVER—PREVENTS CROWDING—two very essential features. No lamp fumes can enter below the hover and the same heating principle is applied as to ours or any first class incubator. Fresh air continually circulates FROM THE CENTER OF THE HOVER to the outside. The chicks, INSTEAD OF CROWDING TO THE CENTER move away from it and lie in a circle near the outside of the hover. Hover 4ft. in diameter. Accommodates 500 to 600 chicks. Price \$28.00 without platform.

We give the most far reaching guarantee on both incubator and brooder that any responsible concern can offer on their product.

Feeding Your Chicks for Quick Results

ONE pound of nourishing, well-balanced feed now while chicks are little builds them up faster than twice as much will later.

Start your chicks on Globe Chick Mash. They like it; every particle digests easily, and its body-building properties hurry along the time when you'll have young cockerels to eat or sell, and early laying pullets.

Encourage exercise by scattering Globe Chick Scratch Feed in the litter—make them work hard to get it. This hustling activity strengthens muscles and stirs up a hearty appetite for more Globe Chick Mash, and keeps the digestive organs in good condition.

The variety of cereal, animal and vegetable protein in this mash is just what chicks need to make growth at a time when every little mouthful pays you 100% returns in added weight, strength and vigor.

DICKINSON'S Globe Chick Mash WITH DRIED BUTTERMILK

From hungry chicks to money-making flocks

There is a special Dickinson feed for every age from the three-day chick to the heavy-laying hen. From Globe Chick Mash they step right up to Globe Growing Mash, which keeps them growing when growth can be cheaply made. A little setback in development at this time is never made up. Don't waste your time and money experimenting—insist on Globe Brand Poultry Feeds.

*Your dealer sells Globe Poultry
Feeds or will get them if you
insist. There is no substitute.*

RESULTS TALK

HERE'S THE PROOF

READ WHAT THEY SAY

EARLY LAYERS

MISSOURI

Lay at 3 Months, 8 Days
Kansas City, Mo., July 18, 1921.

Mr. Wm. Shands,
Little Blue, Mo.

Dear Mr. Shands: This may, or may not interest you, but thought I'd put it over on you anyway.

You will remember me by referring to an order from me for 30 chicks when you sent an order of 25, and later of my coming to your place for the balance of the shipment.

At that time I told you of my little rooster crowing at 6 weeks old—that's only part of the story—this hatch came off April 8th. Last Saturday, July 16th, I got the first egg laid by one of the pullets. Figuring that up you will find the time 3 months and 8 days—isn't that going some?

Very truly yours,
W. D. BEATTY,
R. 6, Box 356, Independence, Mo.

FIRST AND CHAMPION SHEPHERD LEHIGH COCKEREL
HEART-AMERICA SHOW KANSAS CITY MO 1921
BRED AND OWNED BY
Wm. SHANDS LITTLE BLUE MO.

SWEEPSTAKE WINNERS

MISSOURI

Bethany, Mo., Sept. 13, 1921.

Mr. Wm. Shands,
Little Blue, Mo.

Friend Shands: Had intended advising you as to my winnings at I promised, sooner, but have been so busy since the close of the fair have neglected it.

The pen won first young pen in their class; the cockerel won championship cockerel of the show and the pen won championship young pen of the show; besides this I won two A. P. A. specials and a special from the National S. C. White Leghorn Club. I claim that's not half bad.

These birds were the big attractions of the exhibit and have had many compliments on them since. With best wishes, I am, Yours very truly,

W. C. BROWN.

SHANDS' WHITE HILL FARMS

Single Comb White Leghorns

have the egg laying habit bred right into them. No bird has room in any mating on White Hill Farms unless a PROVEN LAYER—and best of all we wish to state that our richest prize winning stock is also bred close to our heaviest laying lines. ORDER DIRECT FROM THIS AD.

Feeding Little Chicks the Jamesway

Jamesway Poultry Book

A mine of interesting and valuable information about the new Jamesway type of poultry house; Jamesway ventilation; and Jamesway money makers for poultry raisers, such as dry mash feeders, waterers, metal nests, grain sprouters, etc.

The Jamesway is solving the worst problems in chicken raising and bids fair to revolutionize the poultry industry in many sections of the country.

It saves great amounts of expensive feeds that are now being wasted; increases the egg yield and makes handling the poultry easy, pleasant and profitable.

And the cost of the Jamesway is surprisingly small.

Why not write us now about your poultry problems; say how many hens you keep and what kind; what sort of chicken house you have and what troubles, if any, you have with it, such as too much moisture, foul air or the like. Perhaps we can offer helpful suggestions.

The first weeks are the critical weeks—give your chicks the right start in life!

Upon the growth and vitality your chicks develop in these first weeks depends largely what they will do for you next winter.

The Jamesway little chick hopper keeps the chicks' feed clean and sweet—and you know that cleanliness is the best preventive of white diarrhoea.

It provides an abundance of feed all the time—insures against hungry chicks. And it prevents waste of feed!

Chicks can't get in and scratch around the feed and waste it. Feed saver pan below catches all feed thrown out; feeder lifts out; roof can be tilted up and back and feed saver pan emptied back into the hopper.

The feed saved will go far toward paying for this feeder in one season.

36 in. long; 18 in. high; 18 in. wide; holds $\frac{1}{8}$ bushel of mash, accommodating 100 to 200 chicks. Wood base furnished with feeder without extra cost. Built to last a lifetime.

If there is no dealer in your town handling Jamesway poultry equipment, write for price.

Jamesway Poultry Book No. 1, giving details of other items of Jamesway equipment for the poultry house sent upon request.

Are You a Customer of OWEN FARMS?

More than one-half the eggs laid prior to March 20th by my superb 1922 matings have been sold and shipped to satisfied customers of former years. The remaining eggs have been sold and shipped to new customers or set here at home. Several orders have come from customers who made their first purchase here ten or more years ago. The repeat orders from satisfied customers of former years are the feature of my business that vies me the greatest personal satisfaction.

Try for yourself and see why "Once a customer of Owen Farms always an Owen Farms' customer" has become a truism.

My Pre-eminent Matings of S.C. Reds and Buff Orpingtons

are far and away the best I have ever made. Each mating is carefully described and priced in my complete 80-page mating list. You can visualize the matings almost as well as if you were here, by reading the careful word pictures or descriptions. Write and ask for your copy, if it has not already reached you. No breeder of Reds, or Buffs is so strong that one or more sittings from Owen Farms' superb matings will not better his or her flock in one or more sections.

Owen Farms' Reds

Are better than any other strain in—

*Average type
Perfection of head points
Bone, size and vigor
Soundness of fiery red undercolor
Laying qualities*

Are equal to any other strain in—

*Richness of natural color
Evenness of natural color
Black markings in wing and tail
Richness of natural breast and fluff
Richness of solid clean hackles*

What Else Do You Need for Your Reds?

Owen Farms' Buffs

Are better than any other strain in—

*Bone, size and vigor
Perfection of head points
Smoothness of surface color
Soundness of undercolor
Laying qualities*

Are equal to any other strain in—

Genuine Orpington type.

What Else Do You Need for Your Buffs?

My Reds and Buffs

have made crashing victories at Madison Square Garden, Boston, Chicago, Syracuse and other leading shows. Mating list tells the story. You should read it before you place your egg order for 1922.

Revision Committee Prepares 1923 Standard

THE Standard Revision Committee, under authority of the American Poultry Association to revise the present Standard of Perfection, and to stay in session until the text for the 1923 edition of the Standard should be completed, met at the Lexington Hotel, Chicago, Ill., March 14, 1922. The following members of the Standard Committee were present: E. C. Branch, chairman; Theo. Hewes, Henry P. Schwab, Arthur C. Smith, Walter Burton and George Robertson. Members not in attendance were: Wm. Coates and Harry R. Lewis. Because of their absence, Thos. F. Rigg, president of the American Poultry Association appointed F. L. Platt, a member of the Standard Revision Committee.

Mr. and Mrs. Rigg, formerly Mrs. E. B. Campbell, were present at the meeting and received the hearty congratulations and best wishes of all present. A resolution adopted by the Standard Committee and presented to Mr. and Mrs. Rigg, read as follows:

"The Standard Revision Committee desires to express its warmest felicitations to our worthy President and Secretary of the American Poultry Association upon their marriage, and to wish them long life overflowing with fullest happiness.

"This resolution is hereby spread upon the official records of this Committee as a testimonial of our all good wishes and sincere congratulations."

Production Classes Rejected

A number of good suggestions were found in the report of the Committee of Forty, and these in turn were adopted. The proposition of the Committee of Forty to put production classes in the shows, illustrating females in different stages of egg production, also the recommendations in regard to a chapter in the Standard on market poultry and egg production, were unanimously rejected, and the following resolution was adopted:

"The Revision Commission after due consideration of Paragraph 3, Page 22, relating to production classes and advising their incorporation into the Standard, believes this inadvisable at this time and votes to withhold its approval.

"Inasmuch as the progress of investigation of the relations of type, production and condition is constantly bringing out new information upon this important subject, and it is apparent that some of the best authorities hold quite different views of it; we believe that the object of the foregoing instrument might be more satisfactorily accomplished by publishing such information in a form better adapted to revision, as new knowledge of the matters involved is gained; than by carrying out the instructions to incorporate such information in the Standard of Perfection, which is revised only once in eight years."

The Standard committee was not unmindful of real merit

By FRANK L. PLATT

All Plymouth Rock varieties to have new illustrations—Production classes not adopted—Breed standards approved—Some breeds declared obsolete—R. I. Whites rejected.

in the Standard breeds. In defining the word "breed" in the glossary of technical terms, the following broad definition was adopted: "Breed: A race of fowls, the members of which have distinctive and established qualities in the matter of shape, size, growth, temperament and color of eggs produced." Heretofore a breed has been simply defined as "a race of fowls that maintain separate shape characteristics." This old definition was deemed superficial because white or brown eggs, and temperament as expressed in sitting or non-sitting dispositions, and uniformity of growth and size, are constitutional characteristics that determine pure breeds, just as much as shape is a factor in determining a breed. It was the sense of the committee that the making of a new variety of Leghorns, for instance, that has Leghorn shape but lay 20 per cent or 30 per cent tinted or brown shelled eggs, should not justify the recognition of that variety as a breed. In other words, the meaning of what is a breed, was broadened.

In the matter of strain, a broader definition was applied. Men are advertising all kinds of "strains," even 230 egg strains, etc. In the new definition such loose application of the word "strain" will not be in accordance with the official Standard meaning of that word. The new definition is: "Strain: A family of any variety of poultry that has and reproduces with marked regularity common individual characters which distinguish this family from other strains of the same variety."

General Changes

It should be understood by all breeders and by every member of the A. P. A. that the Standard Revision Committee

has no power to finally settle the questions that relate to breeds and varieties. The Standard Committee can only recommend favorably or unfavorably on the different issues. It is for the association itself, in convention assembled at Knoxville, to receive each recommendation of the Standard Committee and to adopt or reject each recommendation. It is really up to the breeders to read carefully, think hard, and decide each issue on its merits at your Knoxville meeting.

The following general changes were adopted and will be recommended by the committee at Knoxville: Brass is to be defined as a defect in all breeds, whether white, barred or red.

The female in the present Standard has "neck" and "neck feathers;" however, the strutting

This Season's Chicks Make Next Year's Profits

By **W. C. THOMPSON**

Rearing the Chicks Brings up Old, Persistent Problems—Overcrowding, Colony Houses, Sanitation—Feeding the Growing Stock for the Best Growth.

TO the chicken enthusiast the springtime is filled with music, the shrill peeps and cries of baby chicks being alluring sounds, if not true music, because they bespeak activity and life in the poultry yard. The breaking up of winter brings with it the annual persistent problem of rearing young chicks with which to replenish the flocks in another fall, and to earn a bit of extra revenue, perhaps. But, the propagation of baby chicks artificially, and in this day and age the mother hen must have help and assistance, is not an easy task, and it is one that often determines whether or not the poultry venture is a financial success or failure. April probably sees most of the chicks hatched and well on their way under the brooders. There, naturally, follows a season of rearing and growth during which the baby chicks must develop from infants to mature stock.

This growing period is relatively short. In a few weeks those baby chicks are transformed from tiny little creatures into productive pullets and cockerels. Because of this comparatively short period through which the growth and development of young fowls must take place it becomes increasingly important and essential that every attention be paid to inducing and stimulating good, economical, rapid, and safe advance toward maturity. It is the poultry raiser that can successfully carry his young stock through the summer months, the weeks of growth and development, that will find in his investment in poultry a fair and neat profit. It is altogether a problem thus to do, and being a problem, study as to ways and means is in order.

Hardening Off the Chicks.

No baby chicks should be weaned from artificial heat suddenly. The separation from the heated brooders should be made gradually, covering a period of from three to four weeks, depending upon weather conditions, time of seasons, types of brooders and houses used, and other similar conditions. By the time the average March and April hatched chicks are from six to eight weeks of age they should have been weaned safely from artificial heat, and should be ready for transfer to the unheated colony houses in which they are to spend the rest of the summer, growing and maturing. The properly weaned chicks will not huddle together in corners when moved, unless of course weather conditions change suddenly. The transfer should be made in the morning of a bright day, if possible. Give the little fellows a cheerful beginning in new quarters. Remember that they have not been accustomed to changing their homes theretofore. Many a good lot of chicks has been ruined by making the change of quarters on a dark, cold day. Just a little undue chilling works much damage among artificially reared chicks.

Avoid Over-crowding.

There is often a common mistake made by over ambitious chickenmen, and that is the over-crowding of the colony houses into which the youngsters are transferred for summer time. Possibly it is failing to remember that the little chicks, weighing possibly about a pound or perhaps two pounds, are not nearly as large at time of transfer as they will be within a few weeks. Room is an absolutely essential requirement of successful rearing. The growing chicks need air at night, and perch room. A six by eight foot colony house should not hold more than seventy-five chicks when they are first changed. Conditions and the chicks should be closely watched, and whenever the houses seem crowded, the flocks must be thinned out, and parts of them moved.

Move Into Sanitary Colony Houses.

Since the poultryman assumes the role of the mother hen very largely in attempting to raise great numbers of chicks by more or less artificial means, he must bear in mind that if those chicks of which he is caretaker were being reared

through the summer by the mother hens, that they would be kept out in the fields, if possible, where conditions are more apt to be sanitary and healthful. It is a law, even, that is recognized by all successful poultrymen that sanitary colony houses are a prerequisite to uniform growth and economical development of chicks.

Before the first lots are moved out into the growing houses these colonies should have been thoroughly freed from all old litter, dirt, filth, and straw. Sweep out everything that might possible hold over disease germs, or parasites. Disinfect by spraying the entire interior of the houses with a five per cent solution of some good commercial disinfectant. Let it dry out, and furnish new, clean litter. There is no better and more satisfactory litter for summer colonies than coarse pine shavings. They are in themselves slightly antiseptic. They absorb moisture, and keep the colonies clean for a greater length of time than most other litters. Provide fresh air, and lots of it. Keep the houses dry, clean, and sanitary throughout the season. It is true that the growing chicks spend only the nights in the houses, but they do spend those there, and they are close together on the perches at that.

The House Is Not All.

It has just been said that the chicks stayed in the houses only at night, and that is about true. Therefore, the houses are only a part of the environment over which the growing youngsters will range during the hot summer months. The yards or ranges, or fields, as the case may be, come in for a certain and very serious consideration. As a rule the yard has had its surface soil freshly turned during the present season is the safer and more sanitary. Before the chicks are ready for the summer quarters by a few weeks, plow up the soil in the proposed poultry ranges, after having limed the ground rather heavily, especially if there is any reason to fear worms, coccidiosis, or other infectious and contagious diseases which may be carried over from one season to the next in the soil of the yards. Be sure to get all the surface soil turned, up close to the fences, and in the corners as well.

Sow oats and field peas for an early range crop. After this is about four to six inches high it makes ideal poultry pasture crop. Follow possibly by soybeans, then by buckwheat in later summer, with perhaps a few rows of corn for shade as well as green food. But the essential point is that young chicks need to get back to the soil during their period of growth and development, and that soil must be safe.

The colony houses or brooder houses should be movable, and should be placed in a different field or different section of the field or range this spring than they occupied last summer. This is a precautionary measure. The great bulk of the growing youngsters never go very far away from their house. New soil each season will save millions of chicks for America's poultry consumers.

Protection From the Sun.

Growing chicks aren't very big, you know. They can easily become sunstruck, and fatally injured by subjection to the continued hot rays of the summer sun. They absolutely need some shade. It may be natural shade of tree or shrub, or it may be artificial shelter, or planted crop, as sunflowers or corn, but whatever the source do not neglect to provide some sort of shade under which the chicks may find refuge on hot days. The writer has seen heavy mortality on some farms that he has visited among the growing flocks. The owners had forgotten that the chicks could not withstand the heat of summer any more comfortably than could they.

The writer was called a couple of years ago to diagnose the cause of heavy losses in flocks of growing youngsters on a poultry farm of some size. He arrived at the place near noon. There were two thousand (Continued on page 514)

Origin and History of Buff Wyandottes

THE show season of 1921-22 proved to be a banner year for buff varieties of poultry. The remarkable exhibits of Buff Orpingtons and Buff Leghorns at the Chicago Coliseum Show, December last, where numerically the largest and greatest classes of these two popular varieties were staged, and the wonderful showing the Buff Wyandottes made at the Boston and Madison Square Garden shows, clearly demonstrate the stronghold the buff plumaged fowl has on the poultry breeders of America. The Royal Buff Cochins which started the "buff fever" in England three-quarters of a century ago has since spread to newer breeds and varieties which are more refined in tone, even and sound in color than in the great loose-feathered and imposing English Buff Cochin of the nineteenth century. In no other variety has this transition from the variegated or mottled darker or reddish color varying to nearly shading and brown, to the sound even uniform colored buff male and female, been more pronounced than in the Buff Wyandotte.

After the unsurpassed exhibits of Buff Wyandottes staged at the Boston and Madison Square Garden shows, January, 1922, one of America's foremost breeders and fanciers stated at the historic meeting of the American Buff Wyandotte Club held in New York, January 26, that the Buff Wyandotte had made greater progress in one month from an exhibition standpoint than it had in the past two decades. Other prominent breeders and exhibitors present at the club meet voiced the same opinion.

We had the honor and privilege of handling and judging the Buff Wyandotte classes at Boston and Judge L. D. Howell was equally happy and honored in placing the awards at the club show held in the Madison Square Garden three weeks later. We believe he will join us when we state that breeders, exhibitors and judges are practically a unit now on what constitutes ideal Buff Wyandotte male and female in color. The living color illustrations presented by specimens exhibited at these two great shows did more to bring breeders, exhibitors and judges together on the old argumentative color point than all the theoretical discussions, oral or written, have done in the last twenty years. The timely remarks by Judge Leone D. Howell on vigor and size and the buff color talk by Frank L. Platt at the club meet also served the good purpose of pointing out the future course for breeders to pursue in order to place the Buff Wyandotte at the head of the procession of the universally popular buff feathered breeds and varieties.

Buff Wyandottes are going strongly and are very close to the wire now. It is only a question of a very short time when they will pass under it with the blue streamers in full view. They are being driven to the front by good men or better still by true fanciers, to whom the Buff Wyandottes owe their remarkable development into the shapely, beautiful and soft colored golden buff fowl they are today. A good man cannot be kept down; neither can a good breed of fowl.

Buff Wyandottes were so good twenty years ago that some of America's best fanciers bred them and laid the foundation of even better ones to come. The blood lines which produced

By J. H. DREVENSTEDT

Are the Buffs to Rival the Reds in Popularity?—Strong Classes of Buffs at Eastern Shows This Year—The Variety Shows True Wyandotte Type, Soft Level Color, and Substantial Size.

the finest Buff Wyandottes in color twenty or more years ago, are practically the same to be found in the best strains bred at the present time.

The late Clayton S. Mattison did great work in refining the raw material into the finished product of his day. He was one of the most skillful breeders of buff color in this country, a fact fanciers of today will acknowledge and back up by pointing to their own flocks

as being line bred by what may be termed the Mattison system of mating. We had the opportunity twenty years ago to examine Mr. Mattison's Buff Wyandottes at his home yards, as well as in the show room; we also had the opportunity of looking over other fine yards quite recently, and found what produced the true even shade of buff in 1902 practically is doing the same thing in 1922.

No Buff Wyandotte breeder knows this more thoroughly than Andrew L. Riddell, who was possibly the strongest contemporary as breeder and exhibitor of C. S. Mattison at that time. Mr. Riddell is one of the old guard fanciers in the East, still active in breeding and exhibiting Buff Wyandottes, and he has lost none of his early enthusiasm for his favorite variety. Neither has he lost sight of the all-important asset of true buff color, for like Clayton Mattison, no fancier was a greater stickler for color than Andy Riddell. It was only a few months ago he remarked to us:

"I feel as if you started to do away back in the late 90's what Will Card has done for the Reds, that is, to have a buff all one shade and that to be buff. Some people talk about a lemon buff; personally I prefer a lemon to a red buff. I do not care for rich gold buff if it is a red hot shade. I want a soft rich buff without any red to it, and I believe we always agreed very well on the right shade."

That remark brings back memories of the time we were "all to the buff," so to speak, in fact, contributed our share in the efforts to standardize buff color while on the Standard Revision Committee. The leading breeders and fanciers at the beginning of this century were practically agreed on what buff color should be like, and the "soft rich buff without

any red," as Mr. Riddell states, was about the proper shade desired by them. Nevertheless, this shade of color did not always pan out rich enough in the show room under some judges, although in numerous instances the less symmetrical type of the Buff Wyandotte at that time often handicapped a specimen superior in color but inferior in shape, and materially helped the darker and less even colored male and female to win. Sacrificing color for shape, however, was largely instrumental in creating altogether too many unevenly balanced Buff Wyandottes in color, which naturally resulted in less attention being paid to fixing the true buff color in the minds of many breeders. They overlooked the need of the plumage of a buff fowl being "buff all over."

At Boston, 1900.

It was at the National Wyandotte Club meet held at Boston, January, 1900, that the Wyandotte breed made a most impressive showing with 680 exhibit pens. The Whites led in numbers with 32 pens, 28 cocks, (Continued on page 482)

Buff Wyandotte cock heading 1st old pen and 1st hen, Madison Square Garden, Jan., 1922. These two birds were selected by the judge of the class, L. D. Howell, as the representative specimens with which to illustrate the accompanying article by J. H. Drevenstedt.

Back-Lot Incubating, Brooding and Feeding

WE assume you have a supply of eggs ready, none over ten days old. A fresh, newly laid egg is the best of all and produces a chick chock full of vitality. With every passing day the egg produces a chick with just that much less vitality and size and after the egg is past ten days old its usefulness for hatching is past. It may produce a chick when twenty-one days old, if it had plenty of vitality at the start and was properly kept, but the chick will be a weakling and of no use as an egg producer. The reason for this is easily seen. The fresh laid egg is full of the food the embryo chick feeds on while in process of incubation, it forms and makes the body and blood, and the egg produces just as strong or as weak a chick as the food inside the egg is in itself, and no more.

The egg shell is porous and evaporation of the water content of the egg begins as soon as laid. With every passing day a certain quantity of this substance for the chick passes out of the egg and is lost, and the embryo chick in an old egg, lacking the feed to give it strength and stamina and growth, likewise becomes smaller in size, weaker in staying qualities and less vigorous. After ten days, so much of the strength giving qualities of the egg have been lost that while it may give enough life to the growing chick to fully form and finally hatch, yet the resultant chick will be weak and impoverished just as the egg content itself was weak and impoverished. So that the fresher the egg, the better the chick.

We also assume that while you were saving the eggs you have kept them in a moderate temperature, neither hot nor cold, and have turned them over every day. If you will always remember that there is a living organism in each egg that can be killed just like you yourself may be killed, you are a long way toward success. If frozen or over cold, it dies. If kept in a warm place by day it starts to grow just like it grows in the incubator, but, lacking the continual warm air of the incubator at night, the cold night air kills it. For once growth has started, just like a person, life must be continuous or death ensues. You cannot start up life in the egg, then let it lie dormant and start it up again later any more than you can in your own body. So we assume you have neither let the egg get so cold as to die or so warm as to start life only to die again. A cellar is, of course, the ideal place to keep eggs prior to hatching. The object in turning the eggs is that the germ, which always floats at the top of the egg, does not adhere to the walls. Between you and I, I don't believe that the germ in any egg will adhere to the walls in ten days or even a great while longer. I have kept them a month and they hadn't stuck fast then. But lest I be accused of too much poultry heresy, and, from the further fact that it doesn't hurt the eggs to turn them, I advise you to turn them every day.

Now take your basket of eggs to a strong light. Hold each egg up to the light and note if their shells are of one shade all over. A single glance will tell you this. If you see a spotted or mottled egg shell, put that egg in your discard basket. It may hatch, but the egg is not a strong one and won't hatch a strong chick.

Testing the Eggs.

Now put your so far good eggs to the test of a specific gravity egg tester, if you have one. If you haven't one, buy one. It will pay you many times over. I use the Magic Egg Tester because it is the only one I have tried. There may be others just as good. This egg tester is not a scheme to tell you if the eggs will hatch males or females. It is an instrument which is manufactured to tell you if the inside content of the egg is solid and firm and good food for the growing chick to make a rousing, hustling, strong chick or if the content is weak and watery with the consequent chick, if it hatches at all, also weak and impoverished. It does this in a very

By **ALFRED B. GARNER**

The Complete Embryo Chick Must Develop From What Is Within the Egg Shell—Selection and Hatching of This Egg—Brooding and Feeding the Chicks.

simple manner by weighting the egg automatically. You may ask why not save the expense by simply weighing the egg on a regular scale. The trouble is, you must know the weight of the egg in proportion to the size of the egg to know if it is weak or watery, or solid and firm.

On the regular weighing scale a big egg would outweigh the small egg, yet the contents of the big egg may be weak and watery. The gravity tester, by the displacement of water, weighs the egg in proportion to its size; and no matter if the egg is big or small, it never fails to tell you just what kind of contents the egg has inside. Simplicity is the name for it. It is nothing but a sealed aluminum tube with a spring catch on the lower end to hold the egg. The tube is marked into graduations, beginning with XXX at the top, followed by XX, X, 1, 2, 3, 4, and so on down the scale. Take a quart jar or some vessel of that height and fill nearly full of water. Place an egg in the spring end of the tester and drop gently into the water. The water doesn't hurt it a particle, if you simply let the egg dry off slowly outside of any draft. Don't wipe the egg dry. The egg and tester will be immersed in the water to a certain depth. Then read your scale on the tester where it sticks out of the water. You will find very few XXX eggs. An egg that registers that degree will practically hatch itself into a big, husky chick that it will take a meat axe to kill. Probably it is just as well that you won't find many of these, as it has been found that nine out of ten turn out to be cockerels. To this degree the egg tester will tell you the sex.

You will find more XX eggs, but yet not any great number, in all probability. At X the number will increase, and yet more rapidly increase as you get into the 1, 2, 3, etc., eggs. Don't use any egg that registers below "2." Any higher figure than that on the tester scale may hatch, but the chicks will not be worth while. What this tester will do for a certainty is, it will prevent you from filling your incubator with a lot of worthless eggs that either won't hatch or which, if they do hatch, will be nothing but weaklings and runts. It will give you a batch of chicks that will have practically no ailments or sickness and which will grow up into chickens in which you can take a just pride and expect results.

Turning the Eggs.

When you have your eggs selected, place the figure "1" on the one side and a "2" on the opposite side with a lead pencil. Then place the eggs on the trays in parallel rows, the figure "1" uppermost on all of them. By numbering them as indicated, you can tell at a glance when all are turned. While an egg must not be turned over just exactly half every time, yet it is just as easy to do so and then you are sure all are turned. Do this in evening, for several reasons. And start the hatch on a Monday night if possible. This will bring the hatch start about Friday evening and you have a short Saturday and all day Sunday to look after it and see things go right. Now put your trays in the incubator and go to bed. It will take about ten hours before the incubator thermometer settles down to accurate registering after a cold tray of eggs is put in it, and if you are in bed you won't be tempted to help along the thermometer by turning up the lamp flame that has been working properly right along. If it was running correctly four days and nights before, it will do so now. And remember, also, that the same remark applies to the times when you turn the eggs or test them.

Every day fill your lamp and trim your lamp wick by scraping or with a scissors. If you work by day, do this in the evening. The flame is apt to increase in size after lighting and you have time before bed time to see it is properly running again. One thing you must remember, when filling the lamp and trimming, the lamp wick after the time arrives to also turn the eggs, always turn the eggs first. No matter how well you wash your hands, some of the oil (Continued on page 492)

Brooding and Feeding the Baby Chicks

THE most particular task that falls to the lot of the poultry keeper is that of getting the baby chicks safely through the first ten days of the brooding period. This is the real baby period in the life of the chick and if it comes through that stage safely the task of making a chicken out of the chick is usually not a very difficult one. A large per cent of the chicks that die drop off before they have been alive ten days and most of those that pass out later, due to the diseases incident to chickhood, have their fate sealed by some untoward happening of the early brooding period.

The poultry keeper can well afford to "baby" the young chicks during the first few days of the brooding period and to give them every possible attention to assure their getting the right start in life. Two things that baby chicks need in common with most other babies during the tender stage of their existence are adequate warmth and proper feeding. Just because the chick has better control of his faculties when he first comes into the world than most other babies have, many people forget that the cute little balls of down are really babies and they proceed to treat them more like grownups. Even the old hen often appears to have the notion that the little chicks can stand just as much exercise and travel just as fast as she can, and this is one of the things that keeps the natural method of brooding from being an easy way to raise chicks. Many people believe that it is pretty hard to improve on Nature, but when it comes to taking good care of baby chicks, man-made brooders have the old hen backed clear off the map.

Rest and Sleep.

Getting out of the shell is a pretty strenuous job for the new hatched chick and the first thing he needs when this job is finished is rest, and rest is usually not complete without sleep. Therefore, the new born babies in the incubators or under the hens should be disturbed as little as possible during the first day or two of their existence and should be given ample opportunity to sleep and rest in a warm, dark, quiet place. To this end the incubator or hatching nest should be kept darkened and be left undisturbed until the hatch is entirely finished. Then the transfer to the brooder or the brooding coop should be made late in the afternoon so that the baby chicks will have a chance to become used to their new quarters by taking a nice long nap.

The Stove Brooder.

When the stove brooder is used, and there is no better method of handling chicks, the fire should be started twenty-four hours before the chicks are ready for the brooder and the temperature should be so regulated that a thermometer placed at the edge of the hover and one and one-half inches above the floor will register exactly one hundred degrees. Then a retainer of wire netting should be stretched in a circle all the way round the hover at a distance of about eighteen inches from the hover's edge. This is to prevent any little chick from wandering away from the heat and not be able to find his way back before he becomes fatally chilled.

The floor of the brooder house should

By T. S. TOWNSLEY

**First ten days are a critical time
—This baby stage is soon over
and the extra care is repaid—
Brooders that are satisfactory—
What to feed.**

be well bedded to keep out cold by having it covered with an inch of dry soil over which a two-inch litter of finely cut alfalfa or clover is placed.

While it is important that the baby chick, be kept warm, the heat must not be obtained by excluding fresh air if the babies are to thrive. One advantage of the stove brooder is that it furnishes enough heat to permit of adequate ventilation in the brooding quarters without danger of chilling the chicks.

Proper ventilation can be secured in the brooder house by having the north, east and west walls free from cracks and then leaving a part of the south side open. In very cold or stormy weather the open front should be covered with a thin curtain to exclude the cold or storm but should permit fresh air to pass through.

When chicks are brooded with hens a coop of sufficient size and of such construction that the chicks can be fed inside should be provided, and openings should be left in the south side so that the chicks can get fresh air.

The more nearly quiet the chicks can be kept during the first two or three days of the brooding period the more chance they stand of getting a good start. To keep the chicks quiet it is advisable to darken the windows on the brooder house during the first two days the chicks occupy it.

The First Feed.

A good drink is the first thing the chick needs to take into its system, and either milk or water should be placed before the chicks the first day they are in the brooder. The can-lid fountains that are made to screw onto glass fruit jars are fine for holding either milk or water because they keep the chicks from getting wet and also keep the drinking material clean. The most satisfactory fountain lids have a removable disc that fits over the top of the glass jar. When milk is being fed this disc should be removed so that the milk will feed freely, but when water is used the disc prevents a too rapid flow when the jar is shaken or moved.

Milk is the acknowledged best baby food, and nothing will give the baby chicks a better start than to allow them free access to fresh buttermilk or freshly soured skim milk. Milk contains the vitamins needed for insuring good health and also furnishes the animal protein necessary for the proper development of the muscles and other protein tissues. Where milk is available for chick feeding the birds should receive one hard boiled egg for each fifty chicks as a part of the feed after about the third or fourth day. Egg contains both vitamins and animal protein and will help make the chicks grow properly if milk can not be had.

Just before the chick hatches the yolk of the egg is enveloped by the chick's abdomen and this furnishes nourishment so that the chick does not need to be fed until he is several days old.

In fact feeding before the chicks are forty-eight hours old is very likely to start digestive troubles which will cause heavy losses. A good rule in chick feeding is to feed nothing except a few grains of sand until the chicks are at least two days old. The sand should be kept before the chicks in plates or small boxes where they can pick at it and thus get grit into the

Three by six foot colony house and run-way for chicks.

(Continued on p. 514)

Standard Revision Calls for Improved Standard

WITH the Standard Committee already at work and the time at hand for another revision of the Standard of Perfection, the poultry fraternity is confronted with a number of problems. Breeds newly admitted are to be described; several of the staple ones call for changes; and in several instances the model cuts of breeds need to be replaced. As a means of economy, or following the serious objection that pictures soon become obsolete, some advocate doing away with illustrations altogether. In several respects our Standard needs readjustment to meet modern conditions.

There is a growing sentiment favoring the giving out of free information about poultry, of spreading broadcast that which has been heretofore locked within the covers of a copyright work. This is a proposition which savors of good business principles, and calculated to make several fanciers grow where one grew before. But, on the other hand, there is the need of revenue to be considered.

There seems to be a growing dissatisfaction with the American Poultry Association. A feeling is being voiced by some of our most progressive fanciers that results attained are incommensurate with the costs. Already a movement is afoot to popularize a certain breed by publishing its Standard which shall be quite authentic as coming direct from its club, although departing from the text of the Standard of Perfection such description to be freely circulated. This is a project that if carried out is likely to have far-reaching results. Other breed clubs may be tempted to raise the handicap under which they will be left and follow the same course.

Whatever the outcome of such a venture, it is safe to say that the Association is face to face with serious conditions. It is up to the committee in charge of revision to solve the difficult problem of preparing a work which, for the period it is to remain in force shall be the recognized and sole authority in judging, and if it can be made also a consistent help to the breeder by way of carrying expert knowledge of the various problems involved in mating, its scope and possibilities of extensive sales should be correspondingly increased.

Standards Get Out of Date.

I have long cherished the belief that a Standard that purports to remain authoritative for a term of years, considering the constant progress of the ideals of all live and growing breeds, is an outgrown proposition, savoring of the days when a weekly paper sufficed for the news needs of the reading public and travel by stage-coach or upon the raging canal filled the role of rapid transit acceptably. When the winners at our leading shows set the seal of approval each successive season, a Standard to run for a term of eight years becomes a joke. I believe that a year-book, to contain a digest of the season's happenings in poultry matters, to be embellished with views of noteworthy winning specimens, cost to be defrayed largely by advertising matter, and to sell at one dollar retail, would produce an annual income amply sufficient to meet the running expenses of the Association as well as to create a fund for extension work. The advantage of such an annual in keeping poultry matters down to date must be apparent, and must ultimately be adopted. For the present I do not anticipate any departures from time-honored custom. The tendency is toward longer periods between revisions.

The above suggestion, as well as some others embodied in this article, will doubtless be thought radical and altogether too revolutionary to be considered seriously. But the old saying, "desperate cases demand desperate remedies," applies forcibly to our Standard problems. The large volume of really helpful poultry literature extant at the present day (such, for instance, as the American Poultry Journal presents monthly, and Editor Platt's invaluable new work on the American breeds) all this helps to render of mediocre importance a

By FRED W. PROCTOR

Shape Should Not Be Merely Plumage Contour—History of Origin Is Omitted in Some Varieties—The Scales of Points Are Less Useful as the Score Card Goes into Total Eclipse.

Standard which yields no inspiration to the beginner and perpetuates many old and obsolete traditions.

It is now nearly a half century since the appearance of the earliest Standard. The "General Introduction" in the current edition state that "the work of the first Standard makers was so thorough, accurate and far-seeing that but few changes, and those of minor importance have been necessary." This is a de-

served tribute to the original compilers rather than a strictly accurate characterization of the work, for the changes introduced from time to time have not been inconsiderable. A score of years ago, or such a matter, following a suggestion I advanced at that time, the shape and color specifications of the several breeds and varieties were separated. The introduction of model cuts was a distinct departure. Preliminary matter giving general information concerning the several breeds, I believe, was the work of the late Secretary Orr. The three distinct prefaces to the current edition were a recent addition, as also department devoted to general disqualifications and cutting for defects.

Standard Is Built on the Score Card.

We now come to a feature of long standing and one that long since passed from use. The score-card is now an obsolete method of attempting to size up Standard merit. It was based upon false theory and was abandoned for the reason that it proved unsatisfactory in practice. It presumed to express in mathematical symbols what cannot be reckoned in numbers—matters of human sentiment. A cut for a defect represented no fixed quantity, but a mere whim upon the part of the judge that the department from ideal perfection was equivalent to the numeral he chose to bestow upon it. To go still further in absurdity, this ideal he compared the defect with was nothing better than a vague image in his mind's eye.

In practice the score-card was no better than in theory, and the system was ultimately abandoned because the public came to realize its delusive nature. I could devote a chapter to detailing the inconsistencies and abuses associated with score-card use were it necessary. But the system is now long dead and buried, has no hope of resurrection, and I only bring up this issue because the Standard continues to harbor the old delusion and by so doing gives the cue to some who, lacking experience and so inclined to follow such apparent authority, imagine that the Standard's scale of points possesses actual significance to fanciers of experience.

In the January issue of American Poultry Journal Mr. McCollough says: "I have seen some of the best judges in this country judge by the score-card and I cannot honestly say that their work gave as good satisfaction as the comparison method." So much for a recently expressed opinion as to its use publicly in judging. And as to private scoring the Standard rules thusly: "Private scoring of specimens is not advisable and members of this Association are directed not to lend their support to the practice as a selling method." What more do I need to say? If not good as a means of estimating values as a basis of awarding prizes and discountenanced for private use, likewise, why perpetuate this antiquated and practically discarded system?

In instructions to judges the Standard perpetrates this rare bit of folly: "The merit of specimens shall be determined . . . by deducting from the full value of each section of a perfect bird for such defects as are found in the specimen. . . . And it shall be further understood that this system must be applied whether judged by score-card or comparison." In short, the judge is officially enjoined to judge by the scoring system and in the absence of the card to carry the values in his head throughout the process, awarding prizes according to scores thus arrived at. I wish that popular opinion could be voiced to ascertain whether the next revised Standard should retain such rubbish.

Successful Management of Incubators

THE incubator has today come to be a necessity on every well organized poultry plant. Both the small back yard plants and the large, commercial plants, where it is desired to hatch in large numbers, as well as where one wishes to hatch out chickens in the early spring or late winter in order to have them ready to show at the early fall fairs or for early broilers, find the incubator indispensable.

If the beginner will bear in mind that he must not expect too much of an incubator, not to expect more chickens than he would get from hens with the same number of eggs, he will avoid much of the disappointment and many of the discouragements which sometimes follow in the wake of the first attempt at artificial incubation. Taking the season through, anything over 55 per cent in chickens from all eggs set is good work, whether you hatch with hens or incubators. That means two eggs to produce one chicken on the average.

Before buying an incubator familiarize yourself with the catalogs and other advertising matter of the various leading manufacturers. Then use your best judgment as to the size and make of machine best suited to your needs. Personally I prefer hot water machines to hot air, and have had the best success with them, while I have had neighbors that have just as good success with hot-air machines; so really it is only a matter of opinion as to which is the best for the beginner. If others in your neighborhood are using incubators, visit them and if possible learn just what results they are getting. If you know of anyone in whom you have confidence who is running an incubator, get his advice as to the best kind to buy. Learn all you can about a machine before you decide to purchase, and then select a machine that has proved itself capable of doing good work. There are many machines advertised in this paper that will do good work.

Do not let the matter of price have a decided voice in the matter. If an incubator will not do good work, it is dear at any price. If it is well made, dependable and fully and honestly guaranteed, you must expect to pay a fairly good price for it.

On receiving your machine from the manufacturer uncrate it, and remove the book or circular of instructions from the egg chamber. Study this carefully before you attempt to set up the machine.

In setting up your incubator, be guided entirely by the manufacturer's printed directions and do not pay heed to the advice of over-zealous friends and neighbors. You owe it to the manufacturer when purchasing his product to get the machine set up and in running order strictly in accordance with his printed rules.

The best place in which to operate an incubator is a well ventilated cellar where there is no artificial heat. The ordinary house cellar where there is no furnace or heater can usually be relied upon to prove a satisfactory place for incubation operations, provided there are one or two windows which can be opened to admit fresh air. If there is a heater in the cellar a room should be partitioned off in which to operate the incubator, and its ventilation should be independent of the room in which the furnace or other heating apparatus is located.

It is frequently advisable to remove one of the cellar windows where the incubator is operated, and replace same with a course mesh burlap screen. Do not locate an incubator in

By R. L. CHAMBERLAIN

In Setting up the Incubator Follow the Manufacturer's Directions—the Proper Place to Operate It—Heating and Regulating the Machine—How to Turn and Cool the Eggs.

See that the ventilation provides for plenty of fresh air day and night, to carry off the fumes of burning oil and supply the egg chamber with new air full of the life-giving oxygen of outdoor air. The incubator should be placed against the wall, or close to it, where the lamp, the regulator and the doors are easy of access. It must be set perfectly level or the heat in the egg chamber will be uneven, and the flame of the lamp untrue. Sunshine or direct rays of light entering the egg chamber are detrimental and they must be avoided by darkening the windows of the room in which the incubator is operated.

As a general rule you will get better results with the incubator set on a natural earth floor, even though it is a trifle damp, than you will on a board or cement floor; and I would advise the use of board floors only when the ground of the cellar is very wet. When a board floor is used, be sure and have it as firm as possible under the machine, not because the jarring is liable to jar the eggs, but to avoid interference with the sensitive regulating device.

In first heating up the machine, the lamp, heater, flues and egg chamber should be slowly warmed with a flame that burns moderately low in the lamp; a gradual warming that heats the egg chamber in 12 hours is best. The temperature should be kept at 102½ degrees F. for the first week, then raised to 103 degrees F. during the second week. An occasional temperature of 104 or 105 degrees may exist during the second or third week

without injury to the eggs, but more than 105 degrees of heat for any considerable time is fatal to the hatch. A low temperature during the time of hatching is also fatal.

Beginning with the close of the nineteenth day, the temperature may be permitted to rise to 104 degrees, even 105 degrees is not injurious at this time, but a temperature above this is unsafe for the hatch. When the chickens are coming out freely, it shows that the temperature is about right. If they are slow in hatching, the temperature should be carefully coaxed up one degree. Delay in starting to hatch proves that the temperature has run low at some time during the hatch. In case of such delay, the temperature should be increased, and the eggs left in the incubator a day beyond the normal time for hatching.

The incubator should be run empty for three or four days, until regular heat has been established, and the first hatch of a beginner should be with eggs of little value. His experience with the first hatch, or incubation period, serves to qualify him to handle better eggs in future hatches.

The lamp must be filled once each day, night being the best time for doing this. Use only the very best oil that can be obtained. Oil of less than 150 degrees fire-test should not be used. The wick should be trimmed with the thumb and forefinger, and the burner cleaned with a brush. I have found an old toothbrush very good for this purpose. The lamp must be wiped dry and clean each time after being filled.

(Continued on page 502)

Removing a big hatch on twenty-second day.

The Egg and the Chick

THE yolk is the part of a hen's egg which is produced in the ovary. As the yolks begin to ripen and enlarge, the abdomen of the hen becomes larger and softer, for the intestines are becoming more active and are getting bigger. Intestinal development is necessary for the digestion and assimilation of the larger amounts of food necessary for egg production. The vent also becomes larger and the pelvic bones spread apart.

There is only one ovary. Although a right ovary is formed in the embryo at the same time that the left is formed, it degenerates more or less completely, as there would not be room for two eggs to form side by side in the hen's body. Sometimes double-yolked eggs form, but these are due to two yolks being almost simultaneously liberated by the ovary.

The ovary of a laying hen contains yolks of different sizes, some as small as a pin head, and others graduated up to one fully formed and ready to burst from its capsule. From 800 to 2,000 minute yolks have been counted in hens, indicating a tremendous potential capacity in the matter of egg production.

When the yolk bursts the fine skin sack that holds it to the ovary, it is then free for its passage down the oviduct, where it is to be coated with albumen and finally covered with shell. If the hen is being stimulated for egg production, and the yolks are breaking away from the ovary in constant succession, blood spots in the eggs may appear. They are due to a drop of blood from the ruptured yolk sack passing into the oviduct with the yolk.

The oviduct is a white skin, coiled tube. The ripe yolk is deposited in the entrance to the oviduct. It is quickly fertilized, for the spermatozoa of the male traverse the entire length of the oviduct. These spermatozoa are elongated cells which have a head, neck and tail, and are capable of locomotion.

The period of life of the spermatozoa within the oviduct is considerable, for, after the male is removed from a breeding yard the fertility of the eggs laid does not begin to diminish perceptibly until the ninth day, and some fertility can be secured for a period of two weeks. For this reason, there is no certainty about the purity of their eggs for a period of at least two weeks. After a male is placed in a pen, some fertility will show on the second day, and it will be running good after the seventh day.

The germ of the male floats on the blastoderm. This is a whitish disc. It is on top of the yolk, and if the egg is turned over the blastoderm assumes its upper position, owing to the slightly lower specific gravity of that part of the yolk which contains this disc. The blastoderm holds the living part of the egg, from which the embryo chick and all its blood vessels are to start, but it is wrong to assume that an egg is fertile because it shows this little whitish deposit, for all normal eggs have a blastoderm, and the germ of life itself is invisible to the naked eye.

After the yolk is fertilized in the upper part of the oviduct, about three hours are required for the formation of the white or albumen. This substance is secreted in the upper two-thirds of the oviduct.

The egg is now pushed along by muscular contraction of the oviduct for the next process which is the secretion of the shell membrane. Two thin linings of membrane are put around the egg. They are separate, and in the big end of the egg they are apart from one another. Thus the air cell is formed. The older the egg the bigger the air cell, for the greater has been the evaporation of the egg content.

After three hours spent in the formation of the white and three hours in the formation of the shell membrane, twelve to twenty-four hours more are now required for the secretion of the lime substance which is to harden and form the shell,

and for the laying of the egg. This time element condemns the two-egg-a-day theory except as an unusual and extraordinary accomplishment.

Every yolk that enters into the oviduct does not necessarily have to go through all the stages of this process. If the temperature drops suddenly, and the maintenance of the hen's body makes extra demands upon her system, it appears that the partly manufactured egg can be taken back up the oviduct and enter into the body cavity where it may be absorbed by the body as food.

Sometimes the egg making machinery of a hen gets out of order, and the yolks pass directly into the body cavity. In case they are not then absorbed by the body, they may pack and harden in the abdomen. In culling practice, therefore, hens with full, hard abdomens are culled out. These internal layers may have the bright comb, and the faded shanks and beak of good layers, but their hard abdomens indicate a wrong internal condition.

After a fertile egg is laid it will start to incubate at a temperature lower than 103 degrees. Eggs for hatching should be held in a temperature of about 60 degrees. Sixty-eight degrees is the physiological zero for an egg, below which all growth ceases and the egg remains in a dormant condition. A fertile egg kept at 86 to 91 degrees for seven or eight days will show a development equal to that found in a fertile egg incubated at 103 degrees for three days. For this reason infertile egg campaigns are put on in the summer months, and farmers and other producers of summer eggs are urged to swat their roosters. It is likely, however, that these campaigns will not be waged as vigorously in the future as in the past, for, while there is an enormous loss from eggs heating and showing blood rings, it appears that poultry production diminishes in those sections where all the sound stock males are sent to the butcher's block each year and the flocks reproduced by young cockerels.

The egg incubates, that is, the embryo chick develops, by means of cell division. Two centuries ago it was assumed that the fertile germ was a miniature adult, and that the process of embryonic development consisted of enlargement. It is now established that an ovum and spermatozoon of the two sexes unite. This cell divides and forms two; each of these two daughter cells divides, making four; and the progression proceeds rapidly, outrunning the possibilities of mathematics.

The process of embryonic development requires about twenty days, when the chick, fully formed, breaks its shell, and is born to the world. It is one of the miracles of life how each function of the chick is developed. There is the eye with all its marvelous parts, the beak, the shanks covered with little scales, the wings, the internal organs, the skin and down. All of these things are formed during the process of incubation from the material in the egg.

The last thing before the chick excludes itself from the shell, its intestines absorb the remaining yolk, which serves as the chick's first food. It should not be given other food through its mouth until about forty-eight hours have elapsed, so that it may have had time to first utilize the yolk. Digestive troubles result from too early feeding. It is plain that the yolk and albumen contained in an egg, being capable of contributing all the elements of food necessary for the growth and development of the little chicks, are complex mixtures which are capable of making a highly nutritious addition to man's ration.

A Word About Ourselves

The circulation of this issue of *American Poultry Journal* is ninety-five thousand copies. This is not a large special edition for advertising purposes for this month only. Last month we printed ninety-five thousand copies of the March

issue of the Journal. Never before in the history of poultry journalism in America has a publication received such wide distribution as is now enjoyed by American Poultry Journal. Its great circulation carries with it great advantages, but it also bring its share of responsibilities and limitations.

We hold it to be our responsibility to bridge the gap and form a source of contact between the purebred breeder and the thousands upon thousands of poultry raisers who would be benefited by the seed of the sound breeding establishments of this country. We hold it to be our responsibility to ever urge upon the breeder the vision of these thousands upon thousands of flocks that are to be built up and reinforced from time to time by the blood lines of his breeding, that he may never lose the perspective and adjust his breeding operations to the ephemeral requirements of a vain and foolish little circle. We know that no other kind of chicken ever has equaled the well bred fowl and it is our earnest desire that it shall steadily advance in numbers and usefulness.

In extending our field of service to the ninety-five thousand poultry keeper, our limitations become more marked. Each inch of space has become costly to the point where only matter of general interest can be included in our columns. We are unable to print the awards of all the poultry shows that request the use of our space, we are unable to print the details of specialty club affairs, and we cannot give space to write-ups which are of special interest to the breeders themselves. We must leave these matters, interesting and valuable as they are, to the local and specialty papers.

The poultry business has so grown and expanded that the old ideas of what a poultry paper should or should not do must be superseded by what it can or cannot do, and we, therefore, ask our readers to judge us in the light of our circulation which brings with it not only advantages but also responsibilities and limitations.

To Help the Young Judge

Referring to the editorial comment in the last issue of the Journal in regard to poultry judges, in which we said: "It is unfortunately true that there are some poor judges, but could they not be made good judges if they had the opportunity to see and study good quality," D. Lincoln Orr, secretary of the Madison Square Garden Show, writes:

"I would like to help educate two or three good young judges,—men whose attitude toward life would never allow them to get too chesty. The management of the Garden Show will pay the railway fare and Pullman expenses for two, perhaps three, good young fellows to come to the New York show next year and study some special classes to be designated by us later. The only requirement that I would make would be that they should make a detailed report, in writing, of the classes assigned to them; a copy of which is to be given to you and one to me. If their reports should then warrant, I would recommend that their railroad fare and sleeper expenses be given another year. Young men under thirty who have no A. P. A. license preferred. What do you think?"

Mr. Orr's proposal is most lofty and generous. It bears out the best traditions of the Garden show, which has made one man after another, both breeders and judges.

The chief difficulty will be in selection of proper candidates. Young men who have made a start in judging at fall fairs and small shows will undoubtedly be picked, for they have demonstrated their own individual initiative to get ahead as well as their capacity to comprehend something of the breeds and varieties. What a splendid privilege for the two or three young men of this kind who shall be picked each year and given the opportunity to gratify their dreams and ambitions to attend the great Madison Square Garden Show!

The Garden Show provides a liberal education in purebred poultry. Geo. M. Rommel, until lately chief of the Animal Husbandry Division of the U. S. Department of Agriculture, has summed up the recent poultry exhibition in Madison Square Garden in the following way: "The show goes ahead each year. Here are the leaders of the poultry breeding industry come together for contest, for conference, for mutual exchange of opinions and ideas. If you stand long enough at the entrance to the main floor of the Garden Show, you will meet all the leaders of the poultry world before the show is over."

A man may commit the whole Standard to memory and yet not know good quality when he sees it. To give the young

judge an opportunity to see the living models, as bred by the master breeders of America, and shown at Madison Square Garden, is nothing short of giving him a post-graduate course. In suggesting so magnanimous a plan, Secretary Orr puts to practical application the words of Theo. Roosevelt: "Every man owes some of his time and money to the upbuilding of the profession to which he belongs." And in upbuilding the poultry judging profession in America, Mr. Orr will extend the influence of the Garden show, and both the show and its secretary will receive a new prestige which will be forever theirs.

Judge's Card for Comparison Shows

Competition is nowadays so keen that only a limited number of birds in each class can have their cages decorated with ribbons. In order to give the exhibitors something to take home with them we do not want to adopt the German system of awarding five firsts on cocks, five second prizes on the next five cocks, five thirds on another five cocks, and so on down the line until every cock in the class is under a ribbon. But exhibitors of birds that are not placed as well as those that do win, are entitled to a proficient statement from the judge on each of their birds.

We illustrate on the next page a judge's report card which has been adopted by D. E. Hale, secretary of the National Poultry Show, Chicago. Mr. Hale received several requests for information from non-attending exhibitors regarding birds which they entered at the National Show this year. In line with his progressive attitude that the poultry show of the future will be the one that gives the best service to its exhibitors, he will provide the desired information next year to his exhibitors by means of this card.

The exhibitor will be required to pay 25 cents extra for each bird on which he desires a judge's report. If he enters 20 birds at \$2.00 each, he will have to add \$4 to his entry fees for the extra service, making his total entry \$44 instead of \$40. Of each 25 cents, 5 cents will remain with Mr. Hale to cover cost of printing the report cards, paying postage on them and clerical work in addressing them. The remaining 20 cents will go to the judge.

The judge will have to put in extra work to fill out these cards, and will be paid for it on the basis of 20 cents for each card. This will enable the judge to participate in the success of the show. If he draws 100 birds, he will receive approximately \$20 extra; 200 birds in his classes would mean approximately \$40 extra for a little extra work.

It is evident that the judges do not receive enough pay under existing conditions. This card should work out to advantage in this direction, as well as serve to give the breeder the information he desires and is entitled to have, providing a means by which the opinion of the judge may be extended to the exhibitor even though he lives a thousand miles away from the show.

This card will carry to the non-resident exhibitor information as to what prize his bird won, if it did win. It affords a prompt report on each bird.

Over the judge's signature is his statement of the bird's defects and its especial points of merit.

Many exhibitors who are able to attend the show will be interested in having the judge's opinions of their several birds written down in black and white to take home with them. Mr. Hale believes that nearly all exhibitors will want a report on practically every bird they enter, making a total of about 3,000 cards to be filled out at the next National Show.

There is no copyright on this card. Mr. Hale is the first to adopt it. Other shows, large and small, are welcome to use it.

The Conformation of a Chicken

There are judges of poultry who would qualify as technicians. They do not especially value the character and finish of the plumage. Their eye is not filled with the general conformation of a bird. Yet these are qualities that contribute to the general excellence of a bird as it stands in the coop.

The technical judge, however, is never so rash as to pass an opinion on a bird before he handles it. He is not so artistic as to first pose a bird to see its general conformation. Before

sizing up the bird, he immediately grabs it out of its coop to look for the technical disqualifications of side sprigs, stubs, and down; to see if the wings are free from a tip of white and if the bird is sound at the base of its tail; and most important of all, to see if the undercolor is good.

The score card system of judging has encouraged this practice. There is no use to spend time in scoring a chicken and then in the last column disqualify it for down between the toes. So the judge begins by first looking for disqualifications on shanks and toes, even though this necessitates that his first act shall be to hold the chicken upside down, completely throwing it out of condition.

Judges who follow this practice soon become expert in the technique of the Standard. Breeders who come under the scope of their influence produce a pretty sound sort of a chicken, but the great advances in breed improvement are being made by those breeders who show in comparison shows where the finish and balance of a bird are of major importance.

Many different points are necessary to make a complete chicken, just as many trees are necessary to make a forest. A man may fail to see the whole chicken just as a man engrossed in detail may fail to see the forest for the trees.

Let us look at five Leghorn males, sizing up, in each case, the fundamental character of the whole chicken.

The Buff Leghorn cockerel, Fig. 1, was a first prize winner at Chicago some years ago. He fails to fill our eye today. He is a trifle heavy in comb, with a small ear-lobe that puts his head parts out of proportion, one to the other. His tail is scantily furnished, like one would expect to see on a very young cockerel or one improperly grown.

Figure 2 shows a big White Leghorn cockerel. He is heavy in head gear. His

Three grades of quality in Leghorn males.

legs are set too far behind, throwing up his shoulders. His tail joins abruptly to his back, making a sharp angle at juncture of back and tail. He is deficient in the underbody line, his wings projecting beyond his fluff. In short, this bird represents a common type of plain-bred White Leghorn male.

finement, as the serrations are rather small.

These lower set birds, such as No. 3, are said by some to possess strong vitality. Perhaps No. 3 is a stronger bird than No. 4. We should judge them that way; and we would also judge that the pullets from No. 3 would lay a larger egg than those from No. 4.

No. 3, however, is not a stronger bird than the one shown in No. 5. This No. 5 won first as a cockerel in the Single Comb White Leghorn class at the New York show of 1913. He was shown by D. W. Young. This writer was one of the five judges selected to award the special for the best bird in that great show that year. After considerable inspection and discussion of different first prize cockerels in the show, this Dan Young White Leghorn cockerel was given the unanimous vote of the five judges as the best cockerel in the Garden.

The White Leghorn cockerel on the right won 1st at New York in 1913. Shown by D. W. Young.

Figure 3 shows more graceful lines of contour. He is better balanced on his legs, with concave back, and well carried tail nicely furnished. He lacks somewhat in station, being short in the drum-stick, which makes him look squatty. This improvement made, his comb could then stand a little re-

An interesting point is that this bird, bred by Mr. Young, was bred by a man who has stated that he never owned a copy of the Standard of Perfection until after he had won fame as a breeder. While it is probably true that he read little, it is most certain that he studied his birds very much indeed. He studied such matters as balance, station, proportion and harmony of parts. Note how well balanced is this bird. He has station and his legs are well placed under the center of his body. His back sweeps up to a nicely finished tail. The photographer has posed his tail a few degrees too high, but Mr. Young's males did not have the low, sweeping, rainy-day tails of a Japanese Phoenix.

In matter of detail and refinement, observe the relative size of the lobe to the size of the wattles and comb. Each is of proportionate size, giving a balance to the head. The eye is clear and bright.

The cockerel in Figure 4 looks a little like this Dan Young male. But he is lacking somewhere. He has a nice head and good station, a concave back and covered tail. Still he is deficient somewhere.

What he needs is more substance of body. He is twenty per cent narrower across the saddle, from hips to vent. He is again twenty per cent thinner in breast, from shoulders to breast bone. No. 4 also lacks depth of body below his wing line, compared to Mr. Young's bird. In short, No. 4 lack substance.

Some will take No. 4 and say: "There

you have it, a fancy chicken. The fancier produces an active, spirited, nice looking bird, but there is nothing to it." Not so, friends. Look at No. 5. There you see Leghorn type and substance, graceful lines and proportion of parts.

No. 5 was produced by a man who saw a whole chicken, never forgetting for a moment that he had to have a chicken first. The conformation of the whole specimen is the fundamental thing. Fortunately this ideal of a finished and balanced chicken is permeating the entire breeding fraternity and progressive breeders and judges are seeing the absurdity of such a variation of type as flourishes when judging becomes so technical that conformation is sacrificed and prizes are awarded irrespective of body lines and finish of feather so long as the bird has certain particularly correct technique.

The Web of the Feather.

The size and webbing and character of the individual feathers are receiving a great deal of consideration from the best breeders. This is not altogether new. For years the shortness, narrowness and hardness of the feathers on the Exhibition Game and length and profusion of feathers on Cochins have been points of extreme importance. But the American Breeds, being intermediate in size of feather, have been judged for color pattern, undercolor and type. Recently the influence of the size and character of the individual feather on the color and type of the bird has become more fully understood. We are beginning to understand that if we are to have big, round, open centers in a Silver Wyandotte female, she must have big, round individual feathers. She may be perfectly marked according to the Standard description, but if her feathers are small, she will appear much darker in color, for the white centers will be smaller.

Breeders of White Orpington, White Wyandotte, and White Rock females are laying importance on a smooth, hard webbing of the feather. No other kind will web out properly after the wash. Poorly webbed, curling feathers over the cushion are being condemned in a breeding or show bird.

Breeders of Barred Plymouth Rocks and Rhode Island Reds are laying value on a broad feather in the neck, back and saddle. In these top feathers of the male there is a webbed portion, which forms the center of the feather.

In a striped feather, such as you would pluck from the neck of a Partridge, Silver Penciled or Columbian male, the black stripe is confined to this webbed portion of the feather. It is the outer edge of the feather that has a different color.

The outer edge also has a different structure. It is not webbed together. The bars or ribs of the feather are hooked together in the web, by little hooklets that are finer than the sense of sight unaided by a microscope. But the edges of this neck feather are not hooked together.

In a Barred Rock male the barring goes straight across this webbed part of the neck or saddle feather. The crooked bar is the result of the bar shooting off on the edges of the feather. It follows, therefore, that the broader feather you breed in the top plumage of your male, the wider the web that feather will carry, and the more straight barring you will have.

"The Layers Win and the Winners Lay"

Regal Dorcas White Wyandottes

"Lady Jane"—Record 262 eggs in eleven months, American Egg Laying Contest, 1919.

are the most popular strain of this popular breed in America today, because they combine beauty and usefulness to such a marked degree.

Regal Dorcas White Wyandottes are the typical American White Wyandottes, not the slim bodied, high-tailed, beefy-combed kind that are Wyandotte only in name. My birds are the modern kind with low, close-fitting combs, deep bay eyes, rich yellow legs, broad backs, low, well-spread tails and chalk white plumage.

In the laying contests they are invariably near the top while in the show room they acknowledge no superiors. They hold their record for best display at Boston, with a score of 72 points.

At Madison Square Garden, 1919, they won best display with a score of 68 points—40 points more than all my competitors combined.

At the National White Wyandotte Club Meet held in Kansas City November, 1920, the Regals won 43 ribbons on 43 entries—the most wonderful winning in the history of the breed.

In the American Laying Contest at Leavenworth, Kansas, my birds won first over all the heavy weight varieties, eight of my pullets making a combined record of 1,761, an average of over 220 per bird.

If you are not getting good results in fertility or egg production, if your birds are weak in constitution, why not make a fresh start with the Regal Dorcas line? My matings for 1922 are a wonderful success and the 2,000 early chicks in my brooder house give ample proof of this. Do not delay, but reserve your eggs before it is too late.

Eggs for Hatching

Dorcas matings—\$5.00 per 15; \$15.00 per 50; \$27.00 per 100. Special matings (Exhibition or Dorcas)—\$10.00 per 15; \$18.00 per 30; \$25.00 per 45; \$50.00 per 100. All-Star matings—\$20 and \$25 per 15. Utility matings—\$15 per 100. Special Utility matings—\$20.00 per 100.

1000 surplus males and females for immediate sale at bargain prices.

Special value breeding pens, (male and five females) \$40.00, \$50.00, \$75.00 and \$100.

Choice breeding cockerels—\$8.00, \$10.00, \$15.00, \$20.00 and \$25.00. Hens and Pullets—\$5.00, \$8.00 and \$10.00.

Utility cockerels—\$5.00 each.

FREE—Send for 20-page catalogue, fully illustrated, telling all about my 1922 matings. Send 10 cents for copy of my Regal White Wyandotte Book—the information it contains will be of great value to you.

Buff Orpingtons

One of the Oldest and Leading Winning Strains

EGGS from Champion Exhibition Matings

Headed by Grand Champions and Blue Ribbon CHICAGO COLISEUM, NEW YORK AND OHIO STATE FAIR WINNERS and males in direct blood lines with the original MAJOR HUGH ROSE, famous Canadian winning line of New York, Madison Square, Boston, Chicago, etc., winners; descendants of which have for years past and are today, taking leading awards at these imperial shows.

\$15.00 per 15; \$28.00*per 30, selected from one of two choicest matings, or \$10.00 per 15; \$18.00 per 30; \$28.00 per 50; \$50.00 per 100, selected from 10 choicest matings equally.

EGGS from Combination Exhibition and Heavy Layers

\$5.00 per 15; \$9.00 per 30; \$14.00 per 50; \$25 per 100. **BABY CHICKS** at double the above prices; 90 per cent live delivery guaranteed.

All Unhatchable Eggs Replaced Free

Our illustrated Mating List will convince you that "Mayslake" Orpington Eggs are your very best buy of the season.

MAYSLAKE FARMS, HINSDALE, ILL.

F. S. Peabody, Owner. Frank F. Conway, Mgr., (Formerly with HUGH A. ROSE)

In red and buff females it appears that the best undercolor is associated with a poorly webbed surface. As soon as you hit a hard, smooth surface, such as is carried by the Buff Leghorn female, you run into light undercolor. Who has seen deep buff down to the skin in a Buff Leghorn hen or pullet? The first prize Buff Wyandotte hen at the recent New York show, which is illustrated in this issue, had splendid buff undercolor. Her surface, however, was not hard and smoothly webbed. This same thing is seen in Red females, some of which are as rough as a door mat on the surface. Some breeders enthuse over their deep red undercolor clear down to the skin. We notice, however, that they are not

Feathers from a Rhode Island Red male that are webbed all the way down to skin.

much in evidence as winners in the single classes at Boston, New York or Chicago Coliseum. Undoubtedly their color effect is due to structure of the feather as well as pigment in the feather, and what is the use of gaining undercolor at the expense of good, smooth structure in the surface of the feather?

In these days when the breeder is with his birds so much he will find much to interest him in a close observation, not of their plumage as a whole, but of the character of their individual feathers which contribute to and build up that plumage. Some queer things are found sometimes. Occasionally a bird with scarcely no webbing appears—a silky feathered bird—such as is found in the abnormal Missouri Fluff. Wm. Scott Doig, Montana, sends us some feathers from a Rhode Island Red cock in which the web runs all the way down to the skin. It is strange that this should appear in Montana, a cold climate, for it is generally believed that the soft fluff of the under plumage is an effective insulator to protect the body temperature. However, many Reds need more webbing in their plumage, to eliminate the narrow, stringy feathers already referred to, and such a bird as has appeared in Mr. Doig's yards should be bred.

NEW LOW PRICES MILLER BABY CHICKS

20 varieties purebred baby chicks bred for heavy egg production. Win the Prizes this Year with Oak Dale S. C. White Leghorns

Oak Dale's foundation flock was the original, world-famous S. C. White Leghorn flock bred through more than 20 generations by Dan Young. Two years ago Oak Dale purchased in its entirety the sensational branch of the Young strain developed on Owen Farms. These birds and their offspring are now in the breeding pens on Oak Dale. And today, these flocks, combined in one—

Measured by every conceivable Standard make up the greatest flock of S. C. White Leghorns ever assembled in the history of the world. Oak Dale's White Leghorns are assurance of what can be done in the fashioning of flesh and blood, an inspiration to every White Leghorn breeder on this continent—and a challenge!

The Oak Dale strain is indelibly woven into Leghorn history. The blood of the Oak Dale strain in its purity or crossed, doubled or intertwined has produced more outstanding great exhibition specimens and more phenomenal production record specimens than all other distinctive White Leghorn strains put together!

From 1912 to 1922, at the Madison Square Garden, (N. Y.), Boston and Chicago shows, individuals wholly or in part Oak Dale strain blood have won 132 out of 165 blue ribbons!

At the 1922 New York show, all 1st, 2nd, and 3d prizes were won either by customers of Oak Dale, by men breeding the pure Dan Young bloodlines, or by men breeding Young and Owen Farms blood combined.

UNDER NEW MANAGEMENT

Oak Dale's 1922 pens were mated by Mr. Lamon. On March 1st, Mr. Lamon was placed in complete charge of Oak Dale Farm. Every egg, chick and fowl shipped from Oak Dale Farm on and after March 1st has been shipped under the direct personal supervision of Mr. Lamon—an arrangement which assures complete satisfaction to every buyer of Oak Dale Leghorns.

PRESS COMMENT

"The Government's work at Beltsville (all under Mr. Lamon's direction) has shown breeders the line to follow in breeding . . . a S. C. White Leghorn cockerel out of a 222-egg hen whose sire was out of a 245 egg hen, and she in turn out of a 202 egg hen. . . . specimens good enough and fitted well enough to be entered on the main floor in competition." —The Field, N. Y.

By reason of inheritance, individuality, production and transmitting ability, Oak Dale's Leghorns are truly the world's best. The records prove it! If you want to win at Madison Square Garden, or in any other great show, why experiment—send to the world's greatest foundation flock.

Oak Dale's 1922 breeding pens were mated by Lamon, the master breeder, who worked day and night for a week, actually handling every single specimen on Oak Dale Farm. And the owners believe—mark well the prediction—that the progeny of these pens, shown in open competition, will repeat the smashing victories the strain has to its credit, because of the concentrated prepotency in the flock and because of Lamon's genius in mating.

A survey of 100 White Leghorn flocks showed that 97 out of the 100 flocks needed Oak Dale blood to correct defects in type and to increase egg production. The squatty, short-bodied, high-tailed, beefy combed, angular shaped Leghorns in 97 per cent of the breeding flocks can be wonderfully improved by introducing Oak Dale's Strain—wonderful feathering, symmetrical bodies (see photo published herewith) near perfect head points in males and sweeping lines, deep pelvic formations, capacious bodies and refinement in females.

Hatching Eggs Under Mr. Lamon's management, every Oak Dale egg is sold on honor, from the pens you select, newly-laid, fertile. The breeding stock work hard, sleep in ventilated houses, receive vitamins and minerals and are kept in the bloom of health.

Baby Chicks Under Mr. Lamon's management every stocky, plump bodied baby chick shipped from Oak Dale will be bred on Oak Dale. They cost no more than second-raters. This year's State show and State Fair winners will be secured from even the lowest priced chicks hatched on Oak Dale. Even the range flocks are headed by \$50 males.

Send for Free Illustrated Mating List

Sit down and write for catalog or pack your traveling bag and come and examine the pens. Put your trust in Lamon's handiwork; in Oak Dale's concentrated prepotency, heavy egg production, massive saddles, deep bodies, broad backs and near perfect head points. Oak Dale will share its wealth of marvelous breeding power with you. Sit down, write (write Mr. Lamon personally if you wish) and inquire why. Obey that impulse, and write today.

CURRENT NOTES AND COMMENT

Forty Years of Inbreeding.

The article in this issue by Chas. L. Seely, New York State, is of special interest. Mr. Seely is the oldest breeder of Polish in the United States.

The Polish is one of the oldest known breeds of poultry. The White Crested Black variety has been bred by his family since 1845. Mr. Seely is past eighty years of age. His wife passed away last August and he is now living alone. His beautiful Polish are his close friends.

In the past forty years, Mr. Seely has introduced new blood only twice. He writes:

"Only twice have I gotten a male bird outside my own line in forty years. I bred the same as farmers and stockmen do in producing improved strains of grain and live stock. I select the best. No fresh blood has been infused into wild animals and wild birds. With them it is the survival of the fittest. The black birds, quail, partridges and crows fly just as far and as high as ever, but they never receive an infusion of fresh blood.

"Successful line breeding is simply selecting the best specimens to breed from, and never breeding from a small inferior specimen.

"At the Pan American Exposition, 1901, the Canadian breeders of W. C. Black Polish were out with great displays. I won 1st pullet, but they all said that the crests of my birds were too small. In four or five years after that, at the Boston show, I won special in the class for the largest crest. I had enlarged those crests in that time simply by selecting the largest crested birds to breed from.

"Last year my hens laid well and I shipped eggs into twenty different states. You know the vigor of my birds from your own experience. I now have a flock of 10 pullets and 2 cockerels in a yard with an eight foot fence built for Hamburgs, and they fly over this fence like partridges. And these birds are large, lusty fellows."

The above is a contribution to poultry literature. What Mr. Seely writes comes from forty years of experience. It is one thing to experiment with rats in a laboratory, or try to transfer to chickens an experiment with seed corn, but it would take forty years of practical work on the part of a skillful breeder to produce a testimony on inbreeding equal to the above

* * *

That Light and Dark Question.

Again we beg the indulgence of our readers to present a further discussion on Light Barred Rocks and Dark Barred Rocks. The following communication from a Canadian breeder brings out a broad general question that relates to all parti-colored varieties, and should have careful consideration:

"I see you are still hammering away at the Light and Dark Barred Rock question. Keep up the good work. There is only one variety of Barred Plymouth Rocks and that one is described in the Standard of Perfection.

"The pullet breeding male and the cockerel breeding female are the same variety only defective in color. How would it be for the Buff Rock breeders to ask for recognition of their breeding birds that carry black in tail and flights as color feeders? Or the Partridge Rock men to ask recognition for their mottled-red breasted pullet breeders? Then the Red breeders would want a separate variety for their smutty undercolor breeders. And the black fowl breeders would want a class for those dull black hens that they mate to the male carrying a rich, green sheen, to avoid the purple barring that comes from mating too much sheen in both sexes. And so on down the line.

"The Standard is a guide and gives the description of the perfect, finished product. Why spoil it by crowding it full of descriptions of the material used in producing this finished product? How can anyone describe a perfect

breeder without knowing what he is to be mated to? This is a point that often makes me wonder how a judge can go into a class of twenty pullet breeding cockerels and select the best breeder.

"It is not altogether a bird's own characteristics that make him the best breeder. I consider the bird that has the best show record amongst his sisters and other female relatives, is likely to be the best breeder of pullets. As I have never yet seen a bird's pedigree hanging on his coop I wonder how the judge of cockerels in the pullet bred class arrives at his decision."—W. M. Kent.

* * *

Proclaims Poultry Week.

Governor J. A. O. Preus of Minnesota designated the week of March 13 to 16, 1922, as Standardbred poultry week, during which poultry breeders, officers and members of poultry associations, and instructors in agricultural schools and colleges, were urged to give special attention to the improvement of the flocks of the state by encouraging the introduction of more Standardbred stock. In issuing his proclamation, Governor Preus stated that the average egg production in Minnesota was 60 eggs per hen for the year 1920. "This can be doubled," read the proclamation, "with little if any increase in cost of production. Improvement in the flocks can be accomplished by the introduction of Standardbred stock, which will tend to produce more and better flesh and larger egg yields."

* * *

Wisconsin Certified Hatcheries.

H. M. Lackie, in charge of poultry and egg marketing, Wisconsin Department of Markets, sends us a copy of the accredited hatchery plan for the state of Wisconsin. This plan calls for the inspection of the flocks that furnish eggs to the hatcheries as well as an inspection of the hatcheries themselves. To date six large hatcheries, each selling chicks of a number of different breeds, have been accredited, and eight one-breed hatcheries have been accredited.

The Wisconsin Department of Markets has designated a distinctive trade mark to be used on Wisconsin chicks produced by accredited hatcheries. The fees for inspection of flocks are \$2.00 for the first 100 birds and \$1.00 for each additional 100 birds, together with hotel and transportation expenses of inspector. Each bird that is approved is leg banded.

The plan has been worked up by Mr. Lackie in co-operation with Professor J. G. Halpin, head of the poultry work at the State University. It was felt that the breeders and hatchers of Wisconsin who were striving to maintain the quality of their products at a high grade, were in competition with inferior chicks or poor quality and mixed breeding. Therefore, the idea of certifying and issuing a State trade mark to the good hatcheries and breeders has been worked out.

To get on the accredited list, the following regulations are provided:

1. No breeding birds other than those passed by an authorized inspector shall be kept in these flocks during the hatching season.
2. All birds must be purebred.
3. Only one variety shall be allowed on a farm, unless, where more than one variety is kept, ample provisions have been made to keep these varieties and their eggs separate.
4. Each bird must conform in a reasonable degree to the Standard for the breed and variety as set forth in the American Standard of Perfection.

For the season of 1922 this shall be construed as meaning that no birds decidedly off type or color or disqualified specimens shall be allowed to remain in the flock.

5. Each bird must conform in a reasonable degree to the standard for high egg production as set forth by the Poultry Division of the College of Agriculture of the University of Wisconsin.

For the season of 1922 this shall be construed as meaning that females shall have medium length heads, prominent eyes, deep rectangular bodies, soft and pliable in the abdominal region. No extremely small or unusually large, coarse birds or those lacking in strength and vitality shall be passed. Males shall be quick maturing, medium size for the breed, and

from

every egg a chick every chick a producer

Such is the record of Parks Barred Plymouth Rocks for over 31 years. Read the following letters and see for yourself what they do.

"50 chicks received three weeks ago are the finest, strongest and best developed you would want to see. Have not lost a chick."—C. Snyder, Youngstown, Ohio.

"Raised 44 pullets from the 100 chicks. Began to lay at five months and though poorly housed, layed all winter."—M. L. Owen, Hopkinsville, Ky.

"The 100 chicks arrived safely. I have never seen or handled a better lot. They are certainly energy plus chicks."—C. F. Gokiz, New York City.

"Chicks received. All alive and put as week old chicks."—W. L. Cross, Jacksonville, W. Va.

"Chicks arrived in pink of condition. I have 104 smart chicks for my 100 chick order."—C. E. Luckey, Altomont, N. Y.

"The 250 eggs I bought of you arrived safe. Hatched 231 chicks and raised 226 of them."—K. L. Sierbecker, Madison, Wis.

The eggs from you hatched 29 out of the 31."—Mrs. Bowens, Toppenish, Wash.

"I hatched the entire number of eggs you sent me. I am pleased with the 100% hatch."—F. M. Gradiwoll, Wilmington, Del.

"I got 50 eggs of you. They hatched good and the pullets averaged 204 eggs each for the year."—J. L. Whittrick, Jomyn, Pa.

"Pullets raised from your eggs averaged 24 eggs each for January."—V. Lombard, Ridgefield, N. J.

PARKS'

BARRED PLYMOUTH ROCKS

BRED-TO-LAY AND DO-LAY

They've made and hold about all the world's Barred Rock Laying Records. Individual Records up to 313, 323 and 325 eggs in one year. Continuous Laying Records, 148 eggs 148 days, 186 eggs 192 days, 400 eggs 448 days. Small flock averages up to 271, flock of 126 averaged 208 eggs.

1889 to
1922

When you buy Parks Rocks you are buying the results of 31 years of careful trapnesting and pedigreeing. There is no better laying strain for high egg production in the world today. It is our pleasure to say that once a Park's customer you will always be our customer—we have thousands of letters that say so.

Write today for FREE 16-page egg and chick circular, so you can book your orders early.

Safe arrival guaranteed. WRITE ME.

U. R. FISHEL - Box A - HOPE, IND.

BRED IN LINE FOR THIRTY YEARS

Charleston, S. C., March 11, 1921.

Mr. U. R. Fishel, Hope, Ind.

Dear Sir: The birds arrived yesterday in fine shape. My wife and I are very pleased with them and hope they will do as well as those had before. In January we got 244 eggs from 22 hens and in February 248 eggs from 18 hens; besides we have had friers all fall and winter, then too, we have not bought an egg in over two and a half years, except the setting we got from you last February. We incubated a nice bunch last month and have it going again so that we may be assured of chicks for summer and fall.

My wife and I have had many kinds of chickens but The Fishel White Plymouth Rocks beat all, so for the past four or five years we have raised nothing else; of course we keep an expense book so we know just where we stand and since keeping White Rocks we have cleared considerably over 100 per cent every year.

(Signed) J. E. Beckman, M. D.

THE BEST POSSIBLE IN POULTRY

show vitality as indicated by the head and body shape.

6. Each bird shall be strong, vigorous and healthy at the time of inspection. If disease should develop during the breeding season, the affected birds shall be immediately removed from the flock.

7. Each bird shall be sufficiently matured at the time of inspection to reach with reasonable care full growth and maturity by January 1 preceding the hatching season.

8. Close in-breeding shall not be practiced and a statement of the name of the breeder and the known blood lines of all males shall be made to the inspector.

1. Only chicks hatched from eggs produced by accredited hatchery flocks may be sold under the trade mark.

2. All chicks must be normal. Delayed hatches, "help-outs," premature hatches, partially absorbed yolk sacs, weak, deformed, crippled, fed, watered, chilled, or chicks injured in any other way shall not be shipped out under the state trade mark.

3. Chicks shall be not over forty-eight hours old when shipped.

The Right Spirit.

H. P. McKean, Jr., has published an advertisement of his White Leghorns, and after listing the winnings of his own birds at New York, says: "Mr. Schilling won best display by three points."

He goes out of his way and spends his money to tell that Mr. Schilling was a leading winner.

After listing the prizes that were awarded to his own birds at Boston, Mr. McKean informs the reader of his ad that F. D. Rogers was his chief competitor. Mr. McKean then states: "He won the pen classes handily with fine pens. Mr. Rogers came a long way and I compliment him on his sportsmanship as well as on his Leghorns, which are splendid. I wish we had more like him."

Mr. McKean's attitude toward other exhibitors in his variety is most commendable. In referring to his action in this matter he says: "I think that it will probably do me no harm to compliment birds that certainly deserve praise, even though they did not happen to be my own." That is the right spirit!

A. P. A. Election.

The returns of the nominating ballot for officers of the American Poultry Association, are announced by Election Commissioner O. L. McCord as follows:

President: O. R. Ernst, Waverly, Ia., 792; Thos. F. Rigg, Ft. Wayne, Ind., 1,251.

Vice President: H. A. Nourse, St. Paul, Minn., 1,266; A. F. Rolf, New Orleans, La., 753.

Board of Directors.

District No. 2: F. W. DeLancey, York, Pa., 269.

District No. 4: B. E. Adams, Charleston, S. C., 9; Florence Forbes, Albany, Ala., 113; J. M. Gainer, Fayetteville, Tenn., 64.

District No. 6: V. O. Hobbs, Kansas City, Mo., 260.

District No. 8: J. Will Blackman, Los Angeles, Cal., 48; Chas. G. Hinds, San Francisco, Cal., 34.

District No. 9: H. H. Collier, South Tacoma, Wash., 57; A. A. Peters, Seattle, Wash., 146.

District No. 10: E. Greenwood, Victoria, B. C., Canada, 13; John S. Martin, Port Dover, Ont., Canada, 32.

This vote speaks for itself. Thos. F. Rigg should be re-elected president at this time. Following is his own statement in regard to the policy and business affairs of his administration:

"I am a candidate for re-election as president of the American Poultry Association. Since my inauguration last August I have given my entire time and attention to the business of the Association. I am at my desk here at headquarters every day, serving as best I can the men and women who are interested in the breeding, selling and showing of Standardbred poultry, and promoting the interest and safeguard the welfare of the American Poultry Association. This without cost whatsoever to the Association."

White Diarrhea?

Don't Let It Get a Start

White Diarrhea is a germ disease, causing irritation which brings on an inflamed condition of the intestines, resulting in a rapid breaking down of the tissues. Unless soon relieved, it will kill the chick.

Conkey's White Diarrhea Remedy

(78)

tends to destroy the germs that cause the trouble and to allay the feverish condition prevailing throughout the intestinal tract.

Put it in the Drinking Water and the chickens do the rest. It is readily soluble and quickly reaches the seat of the trouble. Also use it as a preventive.

CONKEY'S LICE POWDER, for dusting hens, nests, growing chicks and for use wherever body lice exist.

CONKEY'S LICE LIQUID will immediately rid your fowls and house of mites.

Insist on Conkey's. If your dealer can not supply you, write us. Large Poultry Book sent for 6c in stamps.

The G. E. Conkey Co.

6531 Broadway, Cleveland, O.

Bourne Leg Bands

Are easy to use and can be read ten feet away. Large numbers printed on seven colors of celluloid and held in an aluminum band. Edges rolled so as not to hurt the legs. Good for trapezoiding hens.

Numbers from 1 to 300 on white, red, yellow, blue, cerise, pink and green celluloid. Numbered from 301 to 1,000 on white only. Send for sample and circular. Price 3 cents each.

BOURNE MFG. CO.

231 HOWARD ST. MELROSE, MASS.

\$4 Sparrow Trap

Postage Extra

Extra cage for emptying sparrows, no charge. Fifty sparrows eat 1 bushel of grain a month. Ever-Set Trap stops grain losses, saves money. One man caught 65 one day; another 1,005 in two months. Galvanized wire mesh; lasts indefinitely. Guaranteed satisfactory or money back. Free instructions for setting, baiting. Order direct today. Ever-Set Trap Co., 1002 W. 15th St., Davenport, Ia.

64 BREEDS Most Profitable chickens, ducks, turkeys and geese. Choice, pure-bred, northern raised. Fowls, eggs, incubators at reduced prices. America's great poultry farm. 29th year. Valuable new 100-page book & catalog free. R. F. NEUBERT Co., Box 910 Mankato, Minn.

"The conduct of affairs of the American Poultry Association is a business proposition pure and simple, and is of such magnitude and importance that it demands the entire time and attention and the best efforts of the Association's responsible head.

"Bear in mind that I have been in office but seven short months. That is far too short a time in which to bring out all the important and needful changes. However much has been accomplished for all concerned.

"I stand squarely upon the platform as set forth in my inaugural address. I have no further promises to make—not one. I would like to be given the opportunity to carry to conclusion the policies I have inaugurated. I ask that as a matter of justice and fairness I be given the chance to do this. The very large majority given me on the nominating ballot is conclusive evidence that the members of the Association believe in the principle of the square deal. I ask the privilege of further serving you to the best of my ability."

Thos. F. Rigg.

C. C. DePuy Passes Away.

We regret to learn of the death of Clarence C. DePuy, founder and for many years publisher of the American Poultry Advocate, Syracuse, N. Y. Mr. DePuy has been in failing health for several years, and completely retired from active control of the Advocate three years ago. He was a kindly man, known and esteemed by a large number of poultrymen who were his friends.

The Advocate is now in new hands. W. H. Baigrie is managing editor, and Edward K. DePuy, brother of C. C. DePuy, deceased, is chief editorial writer.

Walter C. Young in Business.

Walter Young, well known as a breeder of Speckled Sussex and judge of all varieties, has gone into the poultry supply business, Dayton, Ohio, selling the local trade. He reports a very heavy demand for hatching equipment among local buyers. This new business will enable him to continue his judging, and he writes that "the coming season promises to be a hummer for the poultry business."

Mr. Lamon to Do the Mating.

Dr. Mohler, chief of the Bureau of Animal Industry, U. S. Department of Agriculture, has arranged with Harry M. Lamon to go to Beltsville once or twice each year for the next two years to mate and select the fowls on the government poultry farm, thus assuring the maintenance of these high production, Standardbred flocks at their present high level.

A Breeders' Show.

Entry at the Illinois State Fair this year will be limited to three varieties shown by any one exhibitor. This will eliminate the string man. The dates have been set back a month to September 16 to 23, and every effort will be made to make a big breeders' show.

Annual Purdue Egg Show.

The Fourteenth Annual Purdue Egg Show will be held at Purdue University, West Lafayette, Ind., on May 1-2-3-4.

The purpose of the show is to encourage the production of more and better eggs, and to show the producers the necessity of marketing more uniform eggs. Farmers of the Central West receive 20 per cent to 40 per cent less for their eggs than do the eastern and far-western producers, because their product lacks the uniformity that the market demands. It is the intention of the show to stimulate interest in egg production and to aid in solving this problem for the farmers and poultry raisers.

Body Lice.

Now we read that body lice may be eliminated by internal medication. Some one may yet come along and say and prove that scaly legs can be cured by clearing up the blood of some sort of contamination.

First prize cockerel at the Chicago Coliseum, 1921

You can now raise birds just like this prize-winner

This is no idle boast—all over the country our customers report to us of the wonderful winnings they are making in show rooms and laying contests. These prize winners were all raised by our customers. Hillview Leghorns are the undefeated champion producers of every season at the shows and laying contests. The records below prove this:

Sweepstake Winners—Coliseum Show, Chicago, 1921: 1-2-5 cock; 1-2 hen; 1-3-4-5 cockerel; 1-2-3-5 pullet; 1st old pen; 1-3-4 young pen; best display and all specials. **Coliseum show, Chicago, 1920:** 2-3-4-5 cock; 2-3-4-5 cockerel; 1-4-5 hen; 1-2-3 pullet; 1-2 old pen; 1-4 young pen; best display and specials. **Coliseum show, Chicago, 1919:** 1-2-3-4 cock; 1-3-4-5-6 hen; 1-2-3-4-5 cockerel; 2-3-4-5 pullet; 1-2 young pen; 1st old pen; best display and all specials. **Coliseum show, Chicago, 1918:** Won silver trophy for best ten Leghorns in the show, all varieties competing.

Egg Laying Contest Winners—1st Prize Pen Missouri Egg Laying Contest 1918: 1st Prize Yearling Hen Pen American Laying Contest 1918. Best record, over all Leghorn pens from Jan. 1st to Oct. 31 in Missouri Egg Laying contest 1920. 1st prize pen against all breeds at Arkansas Laying contest 1921. Official records—257, 243, 263, 217, 251, 248, 202, 257, 230, 243, 240, 246, 267, 221, 233, 208, 238.

Hatching Eggs and Baby Chicks

Every hatching egg and baby chick sold by Hillview is guaranteed to be from some one of its winners—the blood of the greatest Leghorn prize winners. Hillview Leghorns will produce more results for you in actual dollars and cents than any other strain or breed. Place your order as soon as possible to insure your getting some of this great prize winning blood. *Illustrated mating list free. Send for it today.*

TRAP NESTS

of Neimann Make are Best

Galvanized Iron nests are positively sanitary and in purchasing such a nest you are rendering yourself a service that will pay for itself in a short time. Why run the risk of having your birds become infested with lice and mites when you can buy a galvanized trap nest that is positive proof against parasites? The same is true of every Nieman product.

Our products are all made substantially of galvanized iron, are easily taken apart and packed for removal and the prices at which we sell them make their purchase the most economical way of securing fixtures.

WRITE TODAY for Catalog showing prices of these attractive poultry fixtures.

Origin and History of Buff Wyandottes

(Continued from page 467)

42 hens, 57 cockerels, and 41 pullets, the Buffs coming next with 11 pens, 15 cocks, 19 hens, 31 cockerels and 41 pullets. We were present at that show, and had the honor of being assigned to judge the Buff Wyandottes.

George H. Brockenbury, originator of several varieties of Wyandottes and founder of the prepotent Auburn Strain of Buff Wyandottes, was also present at Boston and wrote the club report, which appeared in the American Fancier, January 27, 1900. In his opinion it was the greatest Wyandotte exhibit ever seen in this country with which opinion exhibitors, breeders and judges at this show fully agreed. As Mr. Brockenbury states: "In each variety could be seen more or less improvement in shape and color, more especially in the Buffs. Breeders seem to be improving shape and more especially color. Judging from the fact that the females were quite near to one general color, one can readily infer that breeders are getting nearer to the correct shade of color."

We recall this exhibit of Buffs well enough to state that it was made up of about the hardest classes to judge that we had run against up to that day. There were almost as many strains of Buff Wyandottes on dress parade as there were exhibitors. The best Buffs of the day were at Boston that year. It was there they laid the foundation of the boom to come.

As a matter of historical interest we quote from the National Wyandotte club report, Mr. Brockenbury's criticisms of the Buff Wyandottes at Boston as follows:

First Buff Wyandotte Cock, Herald Square, New York, 1904, and pullet from first prize pen. Owned by Piser and Riddell.

"Passing the Whites without further comment, we come to the Buffs, judged by Mr. Drevenstedt, as were the balance of the Wyandottes. First cock was awarded to a bird shown by Mr. Dutcher. This cock is decidedly the most typical Buff Wyandotte male ever shown and very closely resembles the old foundation sire, "Auburn." First cock was of medium color and might be said to be an even golden buff or rich orange, while C. S. Johnson's 2nd cock was of a somewhat deeper shade, a rich deep golden buff; he could not be said to be a red, because the color is smooth and soft, or mellow, a good bird with a perfect Wyandotte comb. Spreading the wings of 1st cock we find only one color—buff; the outside coloring of both cocks' tails are also a solid buff. Opening 1st cock's tail we find a leaning to smokiness on inner web, almost a solid buff; inner web of 2nd cock's tail has a little black tinged over with buff. Mr. Dutcher's 1st hen, on opening up wings and tail, disclosed nothing but buff color. Mr. Piser's 2nd hen's wing was nearly solid buff; her tail has a little black in inner web, buff outside web. Mr. Piser's 1st cockerel has a very nice even surface color of rich golden buff; his wings, on opening them up, disclosed a very little black. Mr. Dutcher's 2nd cockerel is not quite as even in surface color as 1st cockerel, but has solid buff wings and inner web of tail. Both are of good Wyandotte shape. The pullet class brought out a jewel in the 1st pullet shown by "Jimmy" Forsyth. This pullet comes very near, to my mind, to the ideal buff color. She is very smooth in plumage, the same being soft and fine in texture and showing some glossiness; no black or white in either wings or tail, shape very good. Messrs. King & Whiting's 2nd pullet also showed nice even surface color, good outer web of tail, inner web of tail and wings showing a little dark color, good shape. The entire class of Buff Wyandottes were very creditable to their breeders, and there were many very excellent birds

\$2,500.00 Purina Prize Contest

300 Prizes—win one

YOU don't have to use Purina Chows to enter this contest. Everyone has an equal chance. Just answer these simple questions:—

- 1.—The money paid for Chicken Chowder and Purina Baby Chick Chow will be refunded if baby chicks, when fed these two Chows as directed, do not develop twice as fast during the first six weeks as when fed a grain ration only. *What makes this guarantee possible?*
- 2.—If hens fail to lay more eggs when fed Purina Chicken Chowder and Purina Hen Chow as directed, than when fed any other ration, the money paid for these Chows will be refunded. *What makes this guarantee possible?*

Write your answers in your own way, to both questions, in not more than 200 words in all. A single individual may submit but one set of answers. Literary style and penmanship are not to be judged; just plain straight-forward statements will count. Use pen, pencil or typewriter.

Hints That Will Help You

Send for the 100 page Purina Poultry Book. In it you will find the key to your answer.

Talk with the nearest Purina Chow dealer. You can usually locate his store by the large Purina Checkerboard sign. He can tell you how Purina feeders get broilers earlier than their neighbors; how they raised nearly every chick last year; how this and that poultry raiser gets twice as many eggs by feeding

Purina Chows. Probably he will tell you something about the stability and integrity of the Ralston Purina Company during its 28 years of service to feeders.

Perhaps you already use Purina Checkerboard Chows. If so you can tell about the perfect balance, the clean sound grains, or of some unusual results you have obtained from Purina Chows. The subject is wide open. Write what you think best.

1st Prize \$500.00

Just think what it would mean if you should win the first prize, \$500.00 in reliable Poultry Equipment. Get in the contest, aim high and win. The contest closes 5:00 P. M., June 3rd, 1922. Answers received at our offices later than that time will not be counted. Announcement of winners will be made on July 1st. Use the coupon. Remember 300 different persons will win prizes.

Address Poultry Contest Department

Ralston Purina Company, 801 Gratiot St., St. Louis, Mo.

Feed from Checkerboard Bags

Here are the 300 Prizes

- 1st Prize—\$500.00 in Reliable Poultry Equipment.
- 2nd Prize—\$300.00 in Reliable Poultry Equipment.
- 3rd Prize—\$200.00 in Reliable Poultry Equipment.
- 4th Prize—\$150.00 in Reliable Poultry Equipment.
- 5th Prize—\$100.00 in Reliable Poultry Equipment.
- 6th to 10th Prizes—\$50.00 in Reliable Poultry Equipment to each.
- 11th to 20th Prizes—\$25.00 in Reliable Poultry Equipment to each.
- 21st to 50th Prizes—\$10.00 in Reliable Poultry Equipment to each.
- 51st to 100th Prizes—\$5.00 in Reliable Poultry Equipment to each.
- 101st to 300th Prizes—\$1.00 in Reliable Poultry Equipment to each.
- 300 Prizes in all—amounting to \$2,500.00

All prizes offered are highest quality poultry equipment. Every contestant will receive a copy of the booklet and price-list of the Reliable Incubator and Brooder Co., of Quincy, Ill., showing their line of Incubators, Brooders, Brooder Stoves, Feeders, Fountains, Oat Sprouters, etc. Each winner will be permitted to select, without cost, any merchandise shown in the catalog, up to the amount of his or her prize. All shipping charges on prizes will be prepaid.

The first prize, of course, will be given to the person who sends the best answer to the Purina Poultry Chow Questions; the second prize, for the second best answer; and so on, down to the 300th. The contest is open to everyone except employees of the Ralston Purina Co., Purina dealers, and their immediate families.

Let Me Send You FREE on trial a Pair of Handsome Tortoise Shell Glasses

For many years people have been coming to me from every part of Chicago on account of my wide reputation for supplying glasses that fit. I am now offering the benefit of this wide experience to people everywhere. No matter where you live, I positively guarantee to give you a perfect fit or I promise to send you a pair of glasses that will enable you to see perfectly and satisfy you in every way, or you will owe me nothing. They will protect your eyes, preventing eye strain and headache. They will enable you to read fine print and thread a small eye needle, see far or near.

SEND NO MONEY

I will not accept a single penny of your money until you are satisfied and tell me so. If your eyes are diseased see an oculist, otherwise let me fit you with the right glasses and give you perfect eyesight. Simply fill in and mail the coupon below giving me the simple easy information I ask for and I will send you a pair of my Extra Large Tortoise Shell Spectacles, for you to wear, examine and inspect, for ten days, in your own home. The glasses I send are not to be compared with any you have ever seen advertised. They are equal to spectacles being sold at retail at several times this price. You will find them so scientifically ground as to enable you to see far or near, do the finest kind of work or read the very smallest print. These Extra Large Size Lenses, with Tortoise Shell Rims, are very becoming and your friends are sure to compliment you on your improved appearance. There are no "ifs" or "ands" about my liberal offer. I trust you absolutely. You are the sole judge. If they do not give you more real satisfaction than any glasses you have ever worn, you are not out a single penny. I ask you, could any offer be fairer?

SPECIAL THIS MONTH

If you send your order at once I will make you a present of a handsome Velveteen Lined Spring Back, Pocket Book Spectacle Case which you will be proud to own. Sign and mail the coupon NOW. Dr. Ritholz, Madison & Laflin St., Station C, Chicago, Ill., Doctor of Optics, Member American Optical Association, Illinois State Society of Optometrists, Graduate Illinois College of Ophthalmology and Otology, Famous Eye Strain Specialists.

among, those receiving 3rd, 4th and 5th prizes."

It was due to the good work of the American Buff Wyandotte club that this remarkable exhibit was brought out at the Boston show. A glance at the list of officers elected at Boston in 1900 will remind old Buff fanciers of the fact that good fanciers looked after the welfare of the Buff Wyandottes history is repeating itself for the old club is in equally good and safe hands today.

AT NEW YORK, 1904

At the American Buff Wyandotte club show held at Madison Square Garden, N. Y., January, 1904, Buff Wyandottes made up what can be termed the first really great exhibit held in this country. The special cash prizes amounting to \$100, offered by the club brought out from under cover about all the star Buffs in the East. The following club report will convey a fair idea of the quality at that show:

"BUFF WYANDOTTES"

"(Special Report by C. S. Mattison)"

"Cocks (17)—One of the largest classes ever shown, containing many good birds besides the winners. First was fair in comb, good size and color, wing and tail good, shape not of the best. Second was my choice of the class, good head, even surface, although a trifle dark, good under, wing and tail good, better shape than winner. Third, nice even surface, opens well, trifle coarse in head and fails in shape. Fourth not in show shape. Fifth loses in shape and size.

"Hens (19)—Another large class of remarkably good specimens. First was well placed, good shape and very even mellow surface, opening fine, remarkably good hen. Second as good as first, save too full in cushion. Third another good one, loses in strength of color, hackle not exactly matching in color. Fourth and fifth inclined to be mealy and not as good shape, although both nice hens.

"Cockerels (23)—And some stars; seldom, if ever, does one see as many good specimens. First was a beautifully colored bird, much inclined toward Plymouth Rock shape and ill-shaped comb. Second same shape, also exceptionally fine colored bird, good head. Third rather dark, somewhat uneven surface, too long tail. Fourth a very even fine colored bird, although a trifle dark, elegant shape, opens well, comb a little coarse, should have gone close up to first place. Fifth was my choice of the blue, an elegant shaped bird, best I ever saw, combined with most perfect color, wing and tail practically solid buff, the only fault found was a little more age to fill him out and apparent absence of sickles—he was in my opinion the best bird in the class, with fourth prize bird close up. There were unplaced birds that were fine and could well have been placed.

"Pullets (18)—As a class, the pullets ran dark colored and very sound. First was practically solid buff, top and under fine, save too dark, shape good. Second as good as first. Third off same piece. Second and third perhaps not as clean in tail. Three very sound colored birds. Fourth and fifth lose in shape and evenness of color. There were one or two unplaced pullets of very high quality, one especially fine colored.

"The exhibit generally will go into history as one of the best ever seen and perhaps the largest, a marked improvement in shape and a tendency towards darker birds was manifested. The exhibitors are to be congratulated upon the improvement throughout their exhibit. I have never known of as many sales made and at as high prices at New York as this year; never has the breed enjoyed its present popularity—the high prices paid were a sure indicator of this, as it was among breeders of note who meant business and sales were not confined to those who purchase for pleasure—there is a difference—so far as to gauge the true popularity of a breed—so note it be."

The above criticisms were especially written by Mr. Mattison at our request, as he was not an exhibitor in any of the classes, and possibly the most competent expert of the variety living at that time.

Among other breeders prominent at that time were Mattison & Dutcher, Dr. Sanborn, R. G. Buffington, Wm. Edgar, Warren T. Lord, M. F. Delano, S. A. Horoland, Geo. W. Weed, H. M. Ingalls, F. W. Corey, James Forysth, F. W. Church, Irving Brocker, in the East; and W. R. Wooden, Eugene Sites and Ben H. Smith in the West.

At the New York State Fair in September, 1904, another strong showing of Buff Wyandottes was made. M. F. Delano, then of Millville Poultry Farms, and R. B. Robbins, dividing the prizes.

At the inaugural Herald Square Show, held under the roof of Macy's Department Store building, Broadway and 34th Sts., New York

AURORA BAND CO. 77 LaSalle St., AURORA, ILL.

City, December, 1904, Buff Wyandottes again made an impressive exhibit, both type and color running quite even, in fact, the birds as a whole were the most uniform we had found up to that time.

From an old reprint of a sketch made by Arthur O. Schilling of the winning pen at that show, we reprint a pair—cock and hen—which portray the types found in the winning males and females of that time, although due allowance should be made for the "artistic license" of the then young and budding artist, which served to idealize the shape characteristics somewhat. The cock bird, however, is portrayed quite faithfully in shape, which is about the typical shape of a Buff Wyandotte male found twenty years ago among exhibition specimens averaging quite sound in color.

BOSTON AGAIN THE BATTLE GROUND

At the Boston show, January, 1905, Eastern breeders of Buffs staged a battle royal with 114 birds, including 14 cocks, 16 hens, 21 cockerels, 17 pullets and 9 pens. The awards were split up with that clever showman, A. C. Hawkins, capturing the blue ribbon with a very large cock of good type, deep, full breast, good back, well furnished tail, and a rich even golden buff surface color and fairly strong undercolor, comb large and somewhat coarse; the second prize going to Mattison & Dutcher on a most shapely bird, in fact, a Wyandotte all over, deep, rich buff in color with solid buff undercolor, but a trifle darker in wings and tail than first, a male bird hard to excel in those

Buff Wyandottes, winners at New York, owned by Jas. Forsyth, 1895.

days. Hens were unusually fine, the first almost ideal in shape and sound in color, the best of the Mattison & Dutcher string.

Cockerels did not average quite as even in color as did the cocks, the second being considered the soundest in color, his only serious fault being a coarse comb. Piser & Riddell took first and Mattison & Dutcher second in this class, which contained great color quality but shape was sadly deficient in some of the unplaced cockerels.

The first prize pullet, another one of the Mattison line of breeding is described as being a fine large pullet with good shape and even rich color all over, undercolor strong in every section; wings free from foreign color, but tail has a lot of dark; head is rather coarse with a poor comb. It was in pens, however, that we find the best test of the status of the Buff Wyandottes of nearly twenty years ago. The first pen (Mattison & Dutcher) proved an easy winner among the nine pens exhibited, the cock being strong enough to make a bid for first place in the single class; the four females matching well in shape and color, the latter being an even shade of buff, tail and wing color being clean and sound. The second pen is also reported as being a very good one in shape and color as far as the individual specimens are concerned, but the females failed to match up as evenly as those in the first pen.

To produce an evenly balanced quartette of pullets or hens for a pen, that run uniform in color and shape, was a true test of the skill of Buff Wyandotte breeders in 1905. It is the only real test of a breeder's skill in 1922, not only in producing the coveted four stars to grace the exhibition pen, but in the string of cockerels and pullets entered in the single classes. One lone star cockerel or pullet may appear in a breeder's yard at most any time, but a cluster of stars are not so haphazardly bred.

Best display in both Single and Rose Combs at Boston and Madison Square Garden the same year. My combined exhibit contained 153 birds and 130 of them in the awards. These sensational winnings made not in the small classes, but among the greatest collection of show birds ever exhibited.

Grand Matings for Hatching Eggs

No other matings ever contained such wonderful specimens as mine this year. Not only do they contain my great winners at Boston and Madison Square Garden but the tested breeders that produced them. The same blood lines and as near as possible the same birds that produced these winners last year are mated again this year, making the most reliable breeding combination for the production of show birds and heavy laying stock ever offered to the buying public. Hatching eggs from these grand matings furnish a splendid opportunity to procure this blood at reasonable prices.

Now Hatching Eggs Time!!

EVERY FORTUNATE is the Poultry Industry and all persons who are engaged in it, because of the fact that the most valuable breeding results in this business can be safely transported almost anywhere in the form of **EGGS FOR HATCHING**. By reason of the great **VITALITY** of Hollywood Farm Stock and our method of packing their eggs for shipment, we **GUARANTEE** 90 per cent fertility, covering all shipments made by us.

IT IS A FACT, Reader, that the world's-record highest individual Leghorn layer—336 eggs—not only was hatched from Hollywood pen-sisters with trapnest records of only 250-259 eggs, but it also is true, absolutely, that **ANY CUSTOMER** of our Farm that season for Hatching Eggs might have received that identical egg in a low-cost setting! Such chances occur frequently in cases where there are years of rigid, selective breeding immediately back of these moderate-yield but highly vigorous specimens.

ALSO IT IS A FACT that from our record-breaking Hollywood Pen No. 5 that produced **TWELVE** 300-eggers and better in **ONE SEASON** and the **ENTIRE** number of pullets from which that were trapped **AVERAGED TO LAY** 255 47/74 eggs in 365 days—that **FROM THIS** unequalled mating of high-producers we sold fully one-half the eggs, **FOR HATCHING**, doing this throughout the breeding season and sold them at live-and-let-live prices. Following are our 1922 prices for hatching eggs, with the records of the birds that are producing them:

200 to 229 Eggs by Males from 250-259 Egg Dam.....	\$5.00 per 15	\$25.00 per 100
230 to 239 Eggs by Males from 260-269 Egg Dam.....	7.50 per 15	35.00 per 100
240 to 249 Eggs by Males from 260-269 Egg Dam.....	10.00 per 15	50.00 per 100
250 to 259 Eggs by Males from 275-279 Egg Dam.....	12.50 per 15	70.00 per 100
260 to 269 Eggs by Males from 283-290 Egg Dam.....	15.00 per 15	
270 to 279 Eggs by Males from 283-290 Egg Dam.....	20.00 per 15	
280 to 289 Eggs by Males from 298-304 Egg Dam.....	25.00 per 15	

We ask 20 per cent payment with orders for deferred shipment; balance before shipment.

You can order with safety direct from this advertisement provided you do not delay.

BREEDING STOCK AND LAYERS FOR SALE—We have for sale the finest lot of Breeding Cocks, Cockerels, Hens, Pullets and Mated Pens ever offered to the American public. All of them are closely related to our many contest winners in all sections of the United States, dating back over a period of six years.

Dont blame the breed ! ~ correct the feed

Before you can get eggs, every hen, whatever her breed, must have a perfectly nourished body, and in addition a large surplus of egg-making elements and in correct proportion.

You can't cheat Biddy with inferior feed. She must have egg-making mash before you get eggs.

Ubiko Egg Mash is a uniform, balanced, dependable egg-making feed. It contains meat meal, bone meal, corn meal, wheat bran and middlings, whole ground oats, corn gluten feed, O. P. linseed meal and dried buttermilk. Analysis: 20% Protein; 4% Fat; 6% Fiber; 8% Ash.

A feed that produces big egg yields is a cheap feed regardless of its price.

Handsomely illustrated booklet, "Poultry Raising For Profit," free for the asking. Write for it today giving the name of your feed dealer.

HANSEN'S RUSSIAN ORLOFFS

Undefeated Champions of America. Still stand supreme, winning at the Chicago Coliseum, 1921, 1-2-3 Cocks, 1-2-3 Hens, 1-2 cockerel, 1-2-3-5 Pullet. This win at one of the World's Greatest Shows with the records made in the National and American Egg Laying Contests proves the worth of these great Cold Weather Fowls. My new 1922 booklet describing the Orloff mailed free on request. Am now booking egg orders for spring delivery.

DR. M. A. HANSEN, IMPORTER AND BREEDER, OSAGE, IOWA.

JUDGING AND SELECTING.

As W. S. Crandell remarked at the recent Boston show: "I do not look for a star in a flock of birds." In other words, Mr. Crandell, who has gone through the mill of experience as a breeder for 16 years, looks up a flock of Buff Wyandottes as a whole and admires that high flock excellence which leads to more or less difficulty in selecting the so-called outstanding bird. All good fanciers and experienced breeders are of the same mind. They fully realize that in well grown line-bred stock, uniformity in type and in color are too closely embodied to determine at first sight which of the money is the best in these qualities. Such flocks cannot be culled; they must be most carefully selected individually and mentally graded into prospective prize winners. Even then, it is no sure thing of the breeder having selected his best cockerel or pullet. What looks to be a 100 to 1 shot in November, may be only even money a month or two later. Not until full maturity of each specimen has been attained can he determine with accuracy the true value of the color and shape properties of such thoroughly well bred Buff Wyandotte cockerels and pullets.

In dealing with young and promising birds we are dealing in futures, so to speak. When judging Buff Wyandottes, it is the bird of today to be considered and not the bird of tomorrow, irrespective of how much better it may be then. If breeders and exhibitors at times fail to take this into consideration, it naturally follows that judges will do the same thing.

We frankly admit it is a great temptation which confronts the judge, when he finds the most promising specimen in point of shape and color, but raw or unfinished, side by side with a most finished one just at the peak in show condition, but not as intrinsically sound in color, albeit fine in appearance and shapely in form, to stretch a point and hand the blue ribbon to the bird of the future. The proper place to do this should be in the breeder's yard and not in the show room.

IN THE WEST

Going back to the year 1904, we find Buff Wyandottes also going strong in the West, for at the St. Louis, Louisiana Purchase Exposition, 158 Buffs were exhibited, including 98 singles and 9 pens, but eastern exhibitors practically made up the exhibit and carried off the prizes, Millville Farms, and Warren T. Lord of the East and Ackley & Page of Illinois, being the leading winners.

Interest in Buff Wyandottes began to grow greater after 1905 and at the Palace show, New York City, December, 1911, 220 Buffs including 26 cocks, 38 hens, 41 cockerels, 45 pullets and 14 pens, were exhibited by 38 exhibitors. This was the American Buff Wyandotte club show. The next club meet was held at Toledo, Ohio, January, 1913, where 267 Buff Wyandottes were exhibited and at Cleveland, Ohio, January, 1915, the club meet, brought out 214 birds. At Chicago, December, 1916, 167 exhibits, including 20 pens were staged. During the war and a few years after, the interest in Buff Wyandottes, like that in other varieties, was not as great or sustained, but during the past two years, Eastern fanciers have again put their shoulders to the wheel with the result that Buff Wyandottes are staging the most remarkable come-back in the history of any breed or variety. That could reasonably have been expected of such a handsome and useful variety. This "come-back" however, should not be measured alone by the numerical strength of the Buff Wyandottes exhibited. It is the remarkable quality of the 1922 Buff Wyandottes exhibited at Boston and Madison Square Garden shows that make this "come-back" of far greater importance to breeders throughout the United States and Canada. It forecasts greater exhibits of higher quality at our future shows and a clearer understanding among exhibitors and judges of what the modern Buff Wyandotte should be in form and color.

The Buff Wyandotte is fortunate in having a specialty club composed of good fanciers to promote its interests, in fact, we know of no other club where such earnest and harmonious efforts are being made to promote the welfare of a variety. Officials and members are a unit in this respect. The few hours we enjoyed at the annual club meet held in Madison Square Garden last January convinced us of the fine morale existing among members. With such men as G. Arthur Cook, Ben Hazleton Smith, W. S. Crandell, L. C. Howell, Andrew Riddell, Jas. T. Huston and Secretary Clark, to run the Buff-8-cylinder car among the members, the Buff Wyandotte is in the hands of proper custodians, namely,—FANCIERS.

SURE QUICK DEATH FOR RATS AND MICE

**Remarkable Triple Strength
Virus Kills Every One
Not A Poison**

Marvelous French Discovery

Rats are your enemies. They destroy your buildings, eat your grain, kill your poultry, start fires and spread disease in every community. You need no longer suffer these losses—You can now in a week's time, easily kill every rat, mouse or gopher with Rat Virus, the great French discovery. Our triple strength virus is the most powerful concentrated deadly virus known, the only sure, safe rodent destroyer.

Triple Strength Virus is absolutely safe to use anywhere—positively not a poison. No danger to chickens, horses, cattle, hogs or dogs. Harmless to children or grown persons. Affects only rodents.

Triple Strength Virus is prepared in a scientific laboratory and contains only Virus germs deadly to rodents. The bottle and corks are sterilized and sealed air tight, so that ALL other germs are excluded. This is why Triple Strength Virus is so deadly. It is tested on rats, mice and gophers before shipment—it cannot fail.

Rats Die Outside

Triple Strength Rat Virus is easy to use. Simple directions show how. A single rat eating the virus gets sick with a contagious plague disease that affects and kills all rats and mice in the immediate vicinity. Rats flee because they become infected with a plague that affects the heart, blood vessels, and lungs, destroying the blood corpuscles and causing suffocation. The rats rush outside where they get fresh air and water. When the diseased rats get outside, they never get back for the disease is then so far gone it kills them. No odor, no dead rats to handle, no live rats to kill.

Special Introductory Offer

We want to prove to you our claim that Triple Strength Rat Virus is the most potent, most powerful—yet non-poisonous and absolutely safe—rat virus on the market. It is a TRIPLE STRENGTH Virus. Contains more living rat virus germs than any other rat killer made and will go one-third to one-half farther. To introduce this powerful Triple Strength Rat Virus, we will make every reader of this paper—for a short time only—a special offer of a regular \$2.50 bottle for only \$1.00 postpaid. This \$2.50 bottle Triple Strength Rat Virus is enough to clear a big poultry house, barn or yard of rats and mice.

Money Back Guarantee

Your money back if it fails. Take no chances this year with traps or rat poisons. Only Triple Strength Rat Virus will positively kill rats, mice and gophers and be absolutely safe and sure. Give it according to directions—if after 30 days' trial you find any rats or mice—we will refund your money without question. Send \$1 bill today sure.

If not convenient to send \$1 today—just send your name and address, a postal will do—pay postman \$1 and a few cents postage on arrival for regular \$2.50 bottle. Remember it costs you nothing if it does not do all we claim.

HISTORY OF THE ORIGIN AND DEVELOPMENT OF THE BUFF WYANDOTTES.

Every new variety of Standard breeds must go through the proverbial "course of sprouts" before it's shape and color can be said to be fixed qualities. The buff plumage varieties had a more or less lengthy period of going through this process of evolution. True buff color is not gotten in a hurry, but once we get it, it hard to let go—in the hands of wise breeders.

"Shape makes the breed and color the variety" is a sort of axiom with breeders of Standard varieties of poultry, and "get the type first and the color afterwards," is commonly understood to be about the proper thing to do. None will question an axiom which embodies Standard shape and color ideals. Whether type should be first and color second, however, will be questioned by experienced breeders and fanciers of parti-colored and buff varieties. Typical shape has changed from time to time, the same as Standard color requirements have up to the point where the breed shape is practically fixed or permanently established. With some breeds and their sub-varieties, shape may be the leading objective point; with others color. It all depends on which quality—shape or color—needs the most immediate attention.

Rome was not built in a day. Neither was any breed of fowl produced in a year or even years, that could honestly claim to be Standard in shape and color on a fifty-fifty basis.

SHAPE AND COLOR

We bred the original Wyandotte—the Silver—when first admitted to the Standard as a breed. It's chief asset then was the rather attractive and characteristic shape, which caused the Wyandotte to be referred to as the "bird of curves." The color markings in those early days were too varied and indefinite, and it took many years before the now beautiful open laced Silver Wyandotte appeared on the scene. During that period of progressive color development, typical shape was sacrificed to some extent by breeders in this country and to almost a dangerous extent by English fanciers. The extent eventually succeeded in getting the desired color patterns, which soon were bred on American Silver Wyandottes, with the result that today we find shape and color off a very high Standard quality embodied in our best American strains. It was a see-saw or give-and-take game between shape and color that Silver Wyandotte fanciers played for many years.

The breeders of Buff Wyandottes were especially up against this same proposition, with the rather important exception of having a fixed color property to breed to, whereas the Silver Wyandotte breeders were groping in the dark seeking their color ideals.

Strange as it may appear to modern fanciers, the true buff color was clearly defined and established long before the present generation of breeders appeared in the poultry world. Moubay, in his "Treatise on Domestic and Ornamental Poultry," (London, England, 1854), refers to Buff Cochins and describes their color as follows: "Under this sub-variety would of course be comprised all the various shades of light and dark buff or fawn, ginger, yellow, etc.; these, however, need not all be described; the amateur may safely trust his eye to suit his fancy without the aid of a book. The pale uniform light buff has now become the most highly prized and esteemed shade of all others; and it has now for sometime been sought after at poultry sales by amateurs with the eagerness almost amounting to furor. The light buffs were first introduced into America by Captain Forbes in 1848; but here they were not well known or reared until a year or two afterwards. The general color must, however, be pure, clear, unbroken light buff, with not a speck of dark markings upon the neck; all the wing and quill feathers, and also those about the tail must be of the same color—clear light buff."

Moubay quotes a noted judge, Dr. Homer, as stating: "But none but the best, finest, purest and clearest colored buffs will do for the future, or be even looked at, there being now so many of other kinds all over the country." That is a pretty up-to-date description to have been written in 1854, and shows the many years of an unflinching ideal for buff color.

The ideal buff color of seventy years ago, is evidently the color American fanciers of Buff Wyandottes and of other buff varieties consider ideal today. It will do no harm for breeders, exhibitors and judges to bear in mind the above important and prophetic statements made at a time when the buff plumaged fowl was the sensation in the English poultry world.

With Buff Cochins swimming at the high tide of popularity way back in the '50's of the last century, it was not strange to find Red

What is the

Best Breed of Poultry

For You to Raise?

Send me your name and address, a postal will do, and I will send you, free, facts that will help you to decide this question. I will send you a booklet that tells of the breed that is the greatest producer of eggs and meat. Also a Bulletin containing helpful and instructive articles on poultry raising. To all who are undecided what kind of chickens to raise; to breeders that are not satisfied with their present breed; to fanciers that want beauty, eggs, meat and profit; to back-lotters and suburbanite poultry raisers who want the best adapted fowl for their purpose; to farmers who want the most profitable breed for them to raise—to all these here's an opportunity to get facts that will help you to succeed with poultry—help you decide which is really the best breed for you to raise. Do not delay. Send your name and address today.

Cochins and Brown Cochins exploited by breeders and fanciers of that period. The Red variety did not "catch on." Of the Browns, Moubray authority remarks: "This color is commonly denominated 'Cinnaman' by poultry writers, from some fancied resemblance between the color of that spice and the lighter shades of the fowls—though we confess we never could see it. We should unhesitatingly place this sub-variety along with the reds and say they are the most ugly of Cochins."

Such unprepossessing "Cinnaman" buff specimens were not entirely missing from exhibits among our buff varieties of fowl several years ago, but happily have now almost disappeared from the show room.

DEVELOPMENT OF THE BUFF WYANDOTTE

A historical discussion of the progress of this variety will prove what an uphill job it was for the originators and others in order to make the Buff Wyandotte meet the exacting Standard shape and color requirements.

We had a little experience, very little, trying to put a new variety on the poultry map. That was before Buff Wyandottes were bred or known. At Vahle's bird store, Philadelphia, Pa., we saw a pair of chickens which resembled the alleged Buff Wyandottes first exhibited on the fall circuits by some of the stringmen. We bought the birds and found them to be faded out Golden Wyandottes. We did not succeed in raising the few chicks hatched, owing to them being killed accidentally. Thereupon we succeeded in securing a pen which we sent to James Forsyth, Owego, N. Y., who also had purchased some alleged Buff Wyandottes, which were Rose Comb Rhode Island Reds in reality. These two lots of birds founded Forsyth's strain of Buff Wyandottes.

M. F. Norris founded his strain by crossing Silver Wyandottes with Rhode Island Reds. They bred fairly true to feather but, like all other strains of that time, were not free from black or ticking in the feathers. Light colored Rhode Island Reds were the foundation of several good Eastern strains. This was before the Reds were known as a breed, for the Buff Wyandottes antedate the R. I. Red as a full-fledged breed by several years.

George H. Brockenbury, Auburn, N. Y., originated a strain of Buff Wyandottes in 1888, from a Golden and White Wyandotte cross, mating the buff chick produced, a cockerel, with a Buff Cochin hen; and in the following year bred the progeny of the two crosses together both ways, with satisfactory results. It was a cockerel from this strain that Frank J. Dutcher, Mass., found to be the progenitor of the high class exhibition specimens bred in his yards. Buff Cochin, White and Golden Wyandotte blood founded the Brockenbury-Dutcher strain.

R. G. Buffinton, like Mr. Norris, used the Rhode Island Red-Silver Wyandotte cross to found his strain.

Faded Rhode Island Reds were also exhibited as Buff Wyandottes in 1891 and later, but were off in both shape and color, but evidently were used to build up strains of this new variety with rather questionable success in our opinion.

When C. S. Mattison started breeding his strain in South Shaftsbury, Vt., in the early '90's, he mated a Brockenbury cock with Buff Wyandotte hens which were exhibited at New York in 1892 by Dr. Aldrich and R. G. Buffinton, which helped to counteract the Rhode Island Red blood and refine the buff color as well as to improve the shape. As Mr. Mattison significantly remarked several years later: "It has been equally as difficult to clean up the other (Buff Cochin strain): The feathered legs are equally as easily got rid of as the green and willow legs. In the R. I. Reds, the slaty undercolor offsets the light undercolor of the Cochin-made Buffs and it strikes me that the Cochin-made Buffs come in for that size and color which have made the Buff Wyandotte and Buff Plymouth Rock of the present time."

Incidentally, Mr. Mattison gives the credit for originating one of the best (if not the best) strains of Buff Wyandottes in this country to Mr. Brockenbury. His Golden and White Wyandotte-Buff Cochin cross, we believe to be the most successful; we felt this years ago, and we have no reason for changing our opinion today. The Rhode Island Red blood used in the production of several strains, it appeared to us, retarded, rather than speeded the progress of fanciers in obtaining both the breed type and sound buff color. The Buff Cochin was the dominant force in respect to color, and played an important part in adding material assistance to bringing out those desirable harmonious lines a shapely Wyandotte should possess.

The work of the early founders of the Buff Wyandotte was largely experimental at first, but gradually became more and more systematic; consequently more productive of uni-

To Be Successful In The Poultry Business, You Must Have

QUALITY CHICKS

Quality Chicks are profitable chicks—and it takes profitable chicks to show a profit at the end of the year.

For the sake of a few cents now, don't lose dollars and dollars next winter! Our

GRADE A CHICKS

are all bred from hens which each and every one have been State tested for white diarrhea. That means real Chick Insurance for every one of our customers. Lord Farms Leghorns are used by more up-to-date money-making poultry farms than any other strain in the East, if not in the whole country. Our mailing list contains the names of over 30,000 customers, and we would be glad to refer to any one of them as to our stock and square dealing.

Get your order for chicks in now, before we are sold out. Every year a lot of folks are disappointed at not getting chicks when they want them; but if we have your order in hand, we can make sure that your chicks go to you just when you want them. So send in your orders without delay.

METHUEN, MASS.

CARBOLA

Paints and Also Disinfects-Dries White

Clean Up

your poultry houses—clean them again and keep on keeping them clean if you expect to make a success with poultry. Clean living-quarters for your chickens are just as important as a proper supply of feed and water. Sickness or disease usually starts in unclean quarters and in such quarters lice and mites are always more plentiful. You are wasting time and throwing money away if you don't keep the buildings clean and sanitary. It is easy to do this—it takes very little time—and the cost is almost nothing if you use

a white paint and disinfectant combined in powder form that is ready to use as soon as mixed with water. It paints and disinfects at one operation. It can be applied with a brush or spray pump to wood, brick, stone, cement or over whitewash. It will not clog the sprayer and doesn't flake, blister or peel off. Harmless to the smallest chick or stock that licks a painted surface. One gallon—a pound of the powder—covers 200 square feet, and it doesn't spoil even after it is mixed with water. It has no disagreeable odor. The dry Carbola powder has no superior as a louse powder, and costs about one-third as much as other brands.

Used Instead of Whitewash and Disinfectants

in poultry houses, stables, hog houses, cellars, outbuildings, etc.; by experiment stations, agricultural colleges and thousands of poultry, dairy and breeding farms. You never will regret giving it a trial. It will save time and labor and make it easier to do work that must be done. Doesn't spoil by standing, so get some today and have it on hand when you want it. Money back if not satisfied.

Your hardware feed, drug or paint dealer has Carbola or can get it. If not, order direct.

HIAWATHA CHICKS—EGGS

WINTER LAYING S. C. WHITE LEGHORNS

Eventually you will decide that the WINTER LAYER is the BREAD WINNER. For EGGS—EGGS and EGGS the year around is what makes poultry pay and pay well, therefore do not delay and start right now and order your HIAWATHA CHICKS and EGGS for the 1922 season. At prices that you can afford to buy. Write today for illustrated price list and circular. Address HIAWATHA POULTRY FARM, Box 94, Crystal Lake, Ill.

form results in breeding for shape and color. Where they left off, good breeders took hold, and to their intelligent labors the variety owes its high estate today. It is "to have and to hold" now, with the further incentive of producing even greater uniformity in type and color in the future.

With the typical shape and head points now comparing favorably with that of other varieties of Wyandottes, size and color would appear to be the objective points to be attained with greater uniformity by breeders, with the question of size being probably the most debatable at the present time.

Judge Howell in his address at the annual club meet in January, spoke at some length on the subject of size and vigor, declaring both to be of vital importance to a variety that is destined to become one of the greatest dual-purpose fowls in this country. His remarks on this important subject appeared in connection with Mr. Platt's report of the New York show.

Size is often misleading, for weight and size do not always harmonize. A male or female of Standard weight with smooth fitting plumage, appears to be of less size than a loose feathered specimen below the Standard weight. The true Wyandotte is not a fluffy or loose-feathered bird, but one of medium size and good weight for that size. Such a specimen is more compactly built and shows finer body lines than the heavier or larger appearing, but less cobby formed male or female. Standard weight with a plump body and comparatively fine bone are the requisites of an ideal Wyandotte for the table. Heavy bone and loose feathering leads to coarseness, which is a handicap on any market fowl. Whether we judge Buff Wyandottes for exhibition or market qualities, size should be governed by the Standard scale, namely, cock, 8½; cockerel, 7½; hen, 6½; pullet, 5½ lbs.

As to laying productivity, we do not believe the size of a hen has anything to do with the number or size of the eggs laid. Large hens of the heavier breeds commonly lay eggs no larger than are laid by smaller hens, whilst bantams lay eggs relatively large for the size of their bodies. The main object in building up a laying strain is to get uniform results in number of eggs laid per capita, and of Standard marketable size and as even in color as possible. This result can only be obtained by careful selection coupled with rigid culling of a flock of layers. Buff Wyandottes, like all other Wyandottes, will lay well, if handled well; and when forced for laying, a procedure which is not calculated to maintain any breed or variety in normal condition for any great length of time—they will be found to have capabilities along this line also.

Back Lot Incubating, Brooding and Feeding

(Continued from page 468)

will adhere and if the eggs are turned with oily hands they will gradually accumulate a film of oil over the shell. This oil cuts off the air and kills the germ.

On the evening of the second day, turn your eggs so the figure "2" is on top. You can usually do this by taking out the last egg in a row and rolling the others to take its place. The figure "2" will show that all are turned. When turning the eggs, have the tray on a table so no current of air comes up from below. Every time you turn the eggs, reverse the tray in the incubator when putting them back. This is to provide that if any difference in temperature exists by reason of the glass in the front door, both ends will be treated alike and all eggs hatch at the same time. Keep your incubator door closed while turning the eggs if the directions accompanying the machine so states. Many incubators advise that the door be kept open to air the machine and this is a good plan. But some incubators take longer to warm up than others. In this respect, follow the directions. This is your daily routine to the end of the seventh day.

On the evening of the 7th day you not only turn the eggs but also begin to cool them off. It is in this cooling off process the amateur usually falls down and helps to spoil the hatch. He is afraid he is cooling too much and places them back in the incubator long before they should be replaced. He evidently has never watched on old hen calmly leave her nest for an hour or more at a time and not go back until her eggs feel stone cold to the touch, yet hatch splendidly. If he did, a little of his fear would leave him. The right way is to first turn your eggs and then let them rest on the table until several eggs, picked at random, and placed against the eyelid are neither warm nor cold, just in between. How long that will take depends on the vitality of the chick in the egg.

**"I Have Found Nothing to Equal It
in the 40 Years I Have Been in Business"**

Buy It by the Bag
Conkey's Buttermilk Feeds are sold at dealers carrying poultry feeds and supplies. Be sure to get them in the original packages.

Says This Well-Known Poultryman

When such experienced poultrymen as Mr. U. R. Fishel, the well-known breeder of White Plymouth Rocks at Fishelton Farms, Hope, Indiana, writes so emphatically regarding Conkey's Buttermilk Starting Feed, it should convince every poultryman in America that Conkey's justifies at least a fair trial this season.

Mr. Fishel wrote: "Conkey's Buttermilk Starting Feed is the best feed for young chicks. I have found nothing to equal it in the 40 years I have been in business."

U. R. FISHEL

**Breeder of White Plymouth
Rocks**

Conkey's

The Original

Buttermilk Starting Feed

1. Conkey's will prevent your big losses of little chicks, due to weakness and disease.
2. Conkey's will give your chickens that quick start in growth that is necessary to insure early broilers and layers.
3. Conkey's will help prevent White Diarrhea, as the lactic acid in the buttermilk used by Conkey's acts as an "intestinal broom," which helps to sweep away unfriendly bacterial disease germs in the delicate digestive tract.
4. Conkey's is low in fibre and just right in protein, scientifically correct. Does not injure or overtax the sensitive digestive apparatus.
5. Conkey's is the only Buttermilk Starting Feed made by the Conkey Original Process, in which the buttermilk is thoroughly incorporated with the other ingredients. We use semi-solid buttermilk only.

Conkey's is different—it is so clean, sweet and genuine. No mill ends, shriveled or unsound grain, weed seed or mill sweepings used—only the best and purest grain. Yet it costs so little for those first eight weeks, no poultryman can afford to be without it.

Don't Break the Conkey Chain of Buttermilk Feeds

There are three of them—one each for Starting, Growing and Laying—each the best for its particular purpose.

After 8 weeks, feed Conkey's Buttermilk Growing Mash. Any feed that is sold for both starting chicks and growing them beyond the first eight weeks is unscientific and unsafe. If your dealer cannot supply you with Conkey's Feeds or Remedies, write us and we shall see that you are supplied.

Free-Conkey's Poultry Book

80 pages full of information about the feeding and rearing of chicks, culling of hens, etc. Tells how to keep chickens healthy and how to make them pay. Whether a beginner or a professional, Conkey's Book is worth dollars to you. Sent for 6 cents in stamps to pay postage.

**THE G. E. CONKEY CO. 6531 Broadway
Cleveland, O.**

Feed It for the First Eight Weeks

When the chicks are hatched, give them clean water with the chill taken off and fine grit, but no feed for 48 hours. Then feed Conkey's Buttermilk Starting Feed dry, often but sparingly for the first few feeds, so they will clean it up, gradually increasing and continue for eight weeks, with occasionally a little green food. If you do this, you should lose very few chicks on account of sickness.

Highest Class Utility Pedigree Poultry

Morris Farm Strain's

winnings and egg records at laying contests have never been equalled by any other farm.

I have bred more contest pens of merit, produced more official 200-egg hens, than any other breeder.

I am the only breeder in the world who guarantees his stock to lay 200 eggs and more.

My Leghorns have been among the leaders at all contests the last six years. "Lady Storrs" still remains the highest Leghorn of 6,000 trapped at STORRS.

My customers have won 11 firsts; 6 seconds; 3 thirds, at laying contests over the world. Lately (1921) winnings 2nd, 3rd prizes in Wyandottes at N. Am. contest.

Reference—Every laying contest, poultry school and agri. college in U. S., Canada or England.

PROOFS

1st prize—North Am. Contest, 1914;
1st prize—Mt. Grove contest, 1914;
1st prize—Storrs contest, 1914;
Highest Leghorn, Storrs, 1916;
Highest Leghorn Average, Storrs, 1916
1st prize—Essex, Mass., 1918;
1st prize—Essex, Mass., 1919.

Leading Leghorns, North American contest; Leading Leghorns, Storrs, contest, Conn.; Leading pen, Canada contest (with Reds) and 3rd place with Leghorns for 1920.

And many other prizes made by customers, which in confidence, I cannot mention.

NOTE—The 300-egg hen is unusual, still my eggs produced a 303-egg Leghorn for Rassmussen of Illinois; and a 302 egg hen for Delamaster, Elmira, N. Y.

LINEBRED, PEDIGREE COCKER-ELS, TESTED COCKS, EGGS, CHICKS, STOCK, CONTEST PENS GUARANTEED TO WIN.

Leghorns 309 eggs; Wyandottes 312; S. C. Reds 289; Buff Rocks 272.

Barred Rocks, White Rocks, R. I. Reds, White Wyandottes, Buff Orpingtons, Anconas and White Leghorns from \$10.50 up. Send for catalog. Postage prepaid with 97 per cent live delivery.

SIEB'S HATCHERY

Lincoln

Illinois

The first time you try this, you will find some eggs stone cold while others are yet practically hot. There are ninety chances to one that the eggs cold long before the rest, are infertile or the germ has died. They have no life in them. An experienced hatcher who can test an egg on the fourth day would have them all out of the incubator long before it is safe for an amateur to test his eggs for fertility and live germs. He doesn't want a stone cold infertile egg laying right up against a warm fertile egg to draw the heat away from the good egg, but the amateur must wait until he, too, is an experienced hatcher before he tries this. So the only way is to leave them in the incubator until the first test. Cool but once a day.

On the 10th evening you will be safe, even as an inexperienced man, in testing your eggs and ascertaining the probable result of the hatch. Get out your tester and examine each egg. The ones with a growing germ will have a clear sharp line sharply defining the air cell and below the air cell the contents, partly down to the bottom, will be dark and opaque. The infertile ones will be light all over and are easily distinguished. The ones where the germ had started to grow but has since died will show a dark ball floating around in the mixture.

Take all the infertile eggs and those with a dead germ out at once. Any doubtful ones put back again, after the proper cooling, for the final test on the evening of the fourteenth day. In this final test every egg that doesn't show the same sharply defined line of the air cell and that is not completely dark below the air cell, will not hatch and should be removed.

For the first seven days, have the temperature as near 102 degrees as you can keep it. From the seventh to the fourteenth day at 102½ degrees, and from the fourteenth day to the end of the hatch at 103 degrees. Don't get scared if the temperature varies. If you come down some morning and find the thermometer reading 97 or 100 degrees, the chances are a 1000 to 1 that the eggs are not injured in the least. It only means that the hatch will be delayed a few hours longer. But one thing you must remember is, don't let them bake. Too little heat, if not too long continued, simply means a delayed hatch. But too much heat if continued too long, means final ruin of the eggs.

Don't keep monkeying with the regulator all the time. If any change in the outside temperature makes a change of heat necessary, do it with the lamp flame and not by the regulator. When you once have the regulator running perfectly you should never change it during the entire hatch except to change from the 102 to the 102½ and to the 103 degrees. Even this is better done by a slight increase in the lamp flame. And do this in the evening too. You have more time then to note the results. And don't think it necessary to change the flame when the thermometer doesn't promptly come back to normal after you turn and air the eggs. It takes several hours for the eggs to again come back to the heat of the incubator. Turn and air them early in the evening and make no changes in the flame until an hour before retiring. This will give you plenty of chance to do it right.

On the eighteenth day stop all turning and cooling. Your work is done and you can't change the result now. As the chick in the eggs grow older and livelier you will notice the lamp flame must be reduced in size to compensate for the heat from the chicks growing bodies. This is especially noticeable at the closing days of the hatch. From the eighteenth day on your work is to see this is done and the chicks not roasted. And from the eighteenth evening until the hatch is over, don't open the incubator door. Not for any reason. If you do, you will most likely spoil the results of all your three weeks of careful work. The eggs now need every particle of moisture don't let it out by opening the door for any reason until every chick is hatched.

THE HATCH

If you have the incubator in a cement floored cellar and keep the floor well sprinkled, you will have ample moisture. If it is placed in a room where such moisture is not available, I have found it a good plan to take a small whisk broom such as you brush your clothes off with and a pan of water as near the temperature of the egg as you can get it, and lightly sprinkle the eggs on both sides on the seventh, fourteenth and eighteenth days, once each time. Don't use cold water nor boil the eggs with too hot water. And sprinkling them don't mean drowning them in a deluge. It means just what it says, lightly sprinkle them.

After all his three weeks of work, Dad wants to see the result. So does the wife and children, and all the children's friends. So Dad and the children and their friends glue themselves to the glass door of the incubator to watch the hatching peeps. If it is in the cellar

he has a candle or flashlight. If in a sunlit room the blinds are thrown up so his work is easier. The progress of the hatch is announced to Mother and further light thrown on the newly hatched peepers for her inspection. All very well and good if Dad isn't anxious to have strong, sturdy chickens or many of them, but all very wrong if he does want healthy chicks and plenty of them. When a chick first breaks the egg and becomes a new inhabitant of this somewhat troubled world, it is just as weak and miserable thing as any newly born creature. In addition, its down holds the gluey slime of the egg. And as they say about woman (she is born filled with curiosity). (Remember, it was they said so, not myself). And, weak as it is, when it sees the halo of light from Dad Smith's candle and the fine masculine face of Dad Smith himself, the handsome one of Mrs. Dad Smith and the very interesting faces of all the little Smith's and their friends, it wants to know what is all about and instead of lying where it was until it had its full strength, it struggles over to ask Dad and Mrs. Dad all about it. It flops and scrambles and struggles over the other hatching eggs in its path, smearing each egg with the slime on its body so the pores of each egg is covered up at the very time that every particle of air is most vitally necessary. In its travels it rests its body from time to time on the newly pipped surface of an egg, pressing the pipped part down again with the slime gluing it fast so it will never pipp again. It finally nearly reaches the glass door to talk to Dad and Mrs. Dad, when it drops down into the colder nursery tray underneath while still wet, promptly catches cold and very probably later dies. And Dad Smith could have saved that chick and the chicks in all the other eggs it clambered over, by simply putting a cloth over the glass door to keep the light away entirely so the chick would stay exactly where it was hatched until thoroughly dried off and had its natural strength. It is up to you, Dad Smith. You must decide for yourself.

As the chick grows in the egg, less flame on the lamp is needed. The growing life in the embryo furnishes considerable heat in itself. And when the final hatch comes, the struggles of the chick to free itself of the shell yet further increases the heat and still less flame is needed. When hatching, 105 per cent is not too much. But don't open the door if you can't see the thermometer. Judge by the height of the damper rise. If you were able to judge by the damper rise if it was 103 per cent as every operator should be able to judge, you can easily tell when it should be around 105 per cent as well. It is vitally important that you do not open the door at hatching time. An open door now means loss of moisture and consequent loss of life. And if Dad Smith will insist on looking in the incubator while hatching, don't get fooled by the newly hatching peeps seemingly gasping for air and open the door "just a little" to help them. Your seeming kindness now is no kindness at all—it means white diarrhea, pneumonia, and death. Put the cloth over the door and then you won't see them. That's the best way.

I have had XXX eggs hatch on the seventeenth day. The XX eggs will invariably start to hatch on the eighteenth day and most all the X eggs as well. The further down the scale on the tester they go, the longer it takes to hatch. The poorest eggs may not hatch until the twenty-first day. I never expect much from these and really am not anxious to have them hatch at all although the chickens, when grown, are not always poor ones. But as you must not feed them under any consideration until forty-eight hours after they hatch, and as the very best place for them until time to feed is right in the incubator, let them all remain right where they are until the end of the twenty-first day. After all are hatched, you can open the door just a trifle at times to begin to harden them off for their first appearance in society.

I know the natural impulse of a new beginner is to buy a large incubator. He reasons that he will have less bother than with several smaller ones. But he should also remember several other things. The average back-lotter must save his eggs over a considerable period of time to fill a large incubator. By the time he has enough saved, his first eggs are practically useless from being held too long. They have dried out so they no longer contain the food for the growing chick they should. The result will be that every chick hatched, except those from the last saved eggs, will be few in number and poor, impoverished creatures at that. Better by far to have a small incubator and use fresher eggs. Again, if you spoil a batch of eggs in a small incubator you have a great deal smaller loss than with a big incubator full. Thirdly, by having two small incubators instead of one big one, both filled at the same time, when you test out the eggs on the tenth day you may be able to

100% Hatched—Raised All But One

Free 96-Page Book Tells Successful Methods of How to Get Big Hatches, Healthy Chicks, and Prevent Loss—Practical information on Brooding, Rearing and feeding Baby Chicks.

HOW would you like to get bigger and better hatches; prevent practically all loss from chicks dying in the shell before hatching, and then, best of all, be able to brood and feed your chicks by money and labor saving methods that have never failed to prevent loss from that dreaded bowel complaint of white diarrhea?

Millions of chicks die annually during the first two to six weeks on account of improper care and feeding.

Millions of fertile eggs fail to hatch on account of improper feeding of the breeding stock; improper care of eggs before setting and often through the lack of simple methods that should be applied to all eggs regardless of how, when or where set.

How would you like to earn a clear profit of \$6.00 to \$10.00 per year from

feeds which are cheapest and nearest to you and be able to supply your chicks with feed properly mixed and proportioned to cause them to utilize all of it, waste none and make the quickest possible growth.

The very best feed, regardless of cost, will not give satisfactory results unless it is properly applied. You must know how and when to feed chicks of different ages to prevent loss from weakness, sickness and bowel trouble.

Officially recognized as one of the world's greatest poultry authorities and most successful poultry farmers, Mr. T. E. Quisenberry, President of the American Poultry School and Directing Manager of the American Egg Laying Contest, has written and published a new 96-page book called "Dollars and Sense in the Poultry Busi-

each of your hens? This is not out of the question. It has been done and is being done by others. It can be done by you.

The very foundation of success with poultry depends upon raising baby chicks with the least possible loss in eggs and chicks and then you must raise and raise well, the very largest possible per cent of chicks and with the lowest possible feed and labor cost.

Besides the great loss in eggs and chicks millions of dollars are wasted and lost annually by poultry raisers as the result of improper feeding methods. Improper feeding always results in weak, sickly chicks, bowel trouble, dead chicks, wasted feed and disappointment.

If you understand the requirements of the baby chicks' fast growing body and if you know what kind of grains and feeds and the proper proportion of each that are best for chicks to really supply their requirements, then you can use as a rule, the grains or

ness," which he will mail you free providing you write him at once before they are all gone. Address him in care of the American Poultry School, Dept. 2067, Kansas City, Missouri, and we promise you Mr. Quisenberry will send you one of these free books by return mail.

Besides giving facts and methods used by Mr. Quisenberry in successfully hatching, brooding, feeding and raising thousands of baby chicks this book outlines methods on "Fighting Lice and Mites," "How to Feed Breeding Stock for Fertile Egg Production," "How to Tell Heavy Layers From Poor Layers," "How to Cut the Cost of Feeding Grown Fowls and Increase Egg Production." His suggestions as given in this free book for culling out drones, slackers and loafing hens that will never earn a profit or pay for their keep, regardless of feed and care, are alone so important that you and all your neighbors and friends should each have a free copy. —Advertisement.

For these 10 Books

Diseases of Poultry.—Every poultryman needs this book. With its aid you can save many of your birds that would otherwise die. The cause, symptoms and care of each disease are put before the reader in such a manner as to be understood at a glance, and the remedies given are simple and very effective. \$1.00 postpaid.

How to Build Poultry Houses.—A new book entirely different from our old book of similar name.—This new book presents the latest approved house designs of those state colleges and agricultural stations that have done noteworthy work along the big educational line of poultry house construction. This book contains the designs of those leading agricultural stations which have had the opportunity to study the problem in a big way for all poultry keepers. No one who is going to invest in lumber or labor should fail to secure this book. Handsomely bound in paper. Price 75c postpaid.

Why Poultry Pays and How to Make It Pay.—A book for the beginners in poultry raising and those who are interested in securing from the business the greatest profit obtainable. In this book you will find a complete discussion of the fundamentals that underlie success; the foundation stock; science in breeding; early hatching; chick trouble; importance of open air housing for growing chickens; early laying; artificial illumination to increase winter egg production. Paper bound and printed on special paper. 75c a copy, postpaid.

place all the good eggs from both incubators into the one and have another incubator to set at once. I raise a good many chicks, more than the average back-lotter, and I never use over a 75 egg incubator. Let the big breeders and those who have large flocks use the big incubators—you don't need them and you'll be foolish to buy one.

BROODING

The article by C. E. Ashbrook, Esq., on the subject of brooding in last month's Journal aroused my ire to such an extent that I must now persuade the Editor to add the following remarks on my system of brooding:

The portion of the article by Mr. Ashbrook to which I most decidedly take exceptions is that wherein he describes the fireless brooder in these words:

"With us the fireless brooder is known as 'the shiver.' The fireless is a satisfactory 'mother' only when enough chicks are inside to create the necessary warmth. One or two chicks slipping into a fireless hover to warm up will find only a disappointment and a chill. A chilled chick is a sick one and a menace to the family of which it is a member."

There is just enough truth in this statement to make it dangerous. If believed, the day of the fireless hover is over. But Mr. Ashbrook should remember there is a right as well as a wrong way to use any article. Because the guest at dinner found the finger bowl very unsatisfactory in which to wash his face and hands after the meal is no just cause to utterly condemn the finger bowl. It was not made to use in that manner any more than the fireless hover was made to use as Mr. Ashbrook has used it for newly hatched chicks in an open-front chicken house. So far as he states that but a cold welcome awaits one or two chicks that use a fireless brooder at one time, he is correct. And it is just that little truth that may cause trouble with those who do not know. And for that reason I want the reader to know just wherein lies the difference between the way I use the fireless hover and the way Mr. Ashbrook used it.

Used his way, it could not succeed. Used my way it will succeed and to such a degree that once used, "all the King's horses and all the King's men" will never get you back to the heated brooder again. I not only promise, I guarantee, that by my method you will have a thousand times less work; better, healthier, and stronger chicks and chickens at less cost than by any other known method. And when I make it this strong, I do so knowingly. I have tried out every known method of hatching and rearing chickens and I make it a point to try out thoroughly everything new that comes out, whether I believe in it or not, and to do it as soon after it comes out as possible. And I say to my readers now, unhesitatingly, that none of them, for a back-lotter, will equal the method I again advise.

To properly use the fireless brooder you must combine it with a small coop. A large coop, especially an open-front coop, will not answer. You want one that will give the chicks protection from wind, storms, cold and dampness in any shape or form. And, it requires that the brooder and chicks shall be kept and tended to in your residence the first two or three weeks. Also, if your work takes you away from home during the day, you must enlist the services of your wife or children twice a day for a few minutes each time. This method is not applicable to large poultry plants for such will not care to gather in the chicks every night and bring them in the house each night. But my articles, as always, refer only to back-lotter, and there is not a genuine back-lotter that can't spend half an hour a day putting the chicks in the brooder at night when they are transferred outside, and carrying them into the house.

THE BROODER

You can make yourself one for little or nothing. It won't be so nice looking or so handy, but it will answer the purpose. Take a box the size of an Ivory soap box. Round out the corners with tin or heavy pasteboard so the chicks can't crowd in the corner. In the middle of both ends and on the sides, nail cleats of wood an inch apart. These form the racks to hold the spring wire and pad at the proper height. Cut a hole in one end of the box large enough to allow a good sized chick to enter and over this arrange a sliding door so it can be opened or closed. In the middle of this sliding door bore a half inch round hole for air, so the chicks have air even when the sliding door is closed.

Now get a strong piece of spring wire large enough to form a loop at one end and to go entirely around the box inside with a few inches over. Over this spring wire sew a piece of soft muslin so the middle will hang baggy about one or two inches in the center. Run one end of the wire through the loop. Now make a cotton filled pad, not stuffed hard

AMERICAN POULTRY JOURNAL, 523 Plymouth Ct., CHICAGO, ILL.

PROTECT the Feed and You'll SAVE Your Chicks

Don't go to the trouble and expense of hatching or buying chicks just to lose them when the loss can so easily be avoided by sanitary feeding.

90 PER CENT OF CHICK LOSSES IS DUE TO FEEDING POLLUTED FEED. One chick with the least suspicion of bowel trouble getting into the feed or on top of the feeder, will spread disease, perhaps the dreaded white diarrhea, through the entire flock with a ruinous loss as the result. The construction of the

CONKEY-NORWICH CHICK FEEDERS

is such that it is absolutely impossible for the chicks to get into or pull out and stand on the feed, OR TO GET ON TOP THE FEEDER. In consequence the feed is always sanitary and hygienic, just as the manufacturer sends it to you. Clean feed builds up your chicks and they live and grow. Polluted feed means sure losses. We will and do guarantee that you will avoid all pollution of feed by using the Conkey-Norwich.

The G. E. Conkey Co. spends large sums of money annually to produce a purely sanitary and hygienic chick feed. THEIR ONLY OBJECT IN ENDORSING AND SELLING NORWICH CHICK FEEDERS IS TO PROTECT THEIR FEED AFTER IT REACHES THE POULTRYMAN'S HANDS. If our Chick Feeder is of enough importance to attract a company the size of the Conkey Company to take it up in order to CARRY THE PROTECTION OF THEIR FEED EVEN TO THE VERY CHICKS THEMSELVES, its value to the poultry industry can well be imagined. It is up to you to protect your chicks as Conkey does his feed.

You will want to get your chicks out in the April

sunshine, but don't forget the showers. Feed outside. It is the greatest thing in the world for developing chicks. We do it and know. But be careful the feed is not wet down by "April Showers" and then soured by a following hot sun. Use the CONKEY-NORWICH WITH RAIN TOP as shown in cut, two on a board, and watch your chicks thrive. The feed is protected from sun, rain, older fowls, even from the chicks themselves, yet they always have access to clean, sanitary feed whenever they want it.

Ask such men as H. Cecil Sheppard, U. R. Fishel, The Kerr Chickeries, Pennsylvania Farms, or any other big producer. They are all using Conkey-Norwich Chick Feeders and getting wonderful results.

Don't let anyone tell you galvanized metal affects sour milk. IT DOESN'T DO IT. Thousands of our Feeders are used exclusively as sour milk feeders, and solve the poultryman's feeding problems completely. Here's evidence from

Pennsylvania Poultry Farm, Lancaster, Penna.

"We are pleased to state we have used the Norwich Chick Feeder this season and can recommend it very highly. In fact, it has solved the poultryman's problem of feeding milk to baby chicks as it never clogs up and is very easy to clean thoroughly."

Send your order immediately for as many Chick Feeders as you require, and they will be shipped under the guarantee that they are the best thing ever invented for baby chick feeding — represent the full value of the money you have invested in them — possess every merit which we claim for them — will give you absolute satisfaction with feed, water or milk.

RELIABLE Standard INCUBATOR

It is today as it was at the beginning, 41 years ago—the leader of them all. In every way first class; best materials are used; best workmanship. Double heating system; maintains uniform temperature with a constant circulation of pure air. Has ample nursery space. Like all Reliable Poultry Appliances and Equipment it is sold upon honor and gives absolute satisfaction.

The Reliable Standard Blue Flame Wickless Oil Heated Colony Hover

the latest achievement and a dominant leader. It is made right, works right; automatically controlled; flame adjustable to heat required. Chicks have fresh air and even temperature. Our canopies are shipped complete, not knocked down. They are ready to attach legs and operate.

RELIABLE COAL BURNING BROODER universally recognized the best. Burns either hard or soft coal. Self heating; easily cleaned; economical; gives steady, automatically regulated heat. Our positive money-back guarantee applies to all Reliable Incubators, Brooders, Hovers, Poultry Appliances and Equipment.

If there is not a Reliable dealer in your locality, write us for Sales Book.

but with the cotton merely laid in the pad without pressing, an inch and a half thick. If you press the cotton in hard the air can't get through. See the pad fits the inside of the box tight so it can't slip down but will rest firmly on one of the wooden cleats you have nailed on. Now cover the bottom of the box an inch or so deep with hay seed or short cut alfalfa, slightly hollowed out in the center for a nest.

For the foundation of this palatial residence build a platform 20x36 inches. For your own convenience, put it on four legs. On the one end put your brooder. To keep the chicks from scratching their food off over the place, build a fourteen inch high fence around it of cardboard and over this, to keep them in, add a 10 inch fence of poultry wire netting. Divide the space not covered by the brooder into two. That closes the brooder, cover with an inch or two of hay seed or short cut alfalfa. The further half cover with the same amount of garden soil. This garden soil is important. There is something in ground which prevents limber legs and death. What it is, I don't know nor nobody else seems to know. Some say it is because they eat the ground. This I don't believe. It acts just the same at the seashore where there is nothing but sand, and feeding them sand as grit won't stop limber legs and death. But whatever it is, garden soil of some kind is important.

Now put your chicks in the brooder. Take your muslin covered spring wire and place it on one of the cleats so that the baggy end of the muslin just touches the backs of the chicks. This is not for heat purposes but to give the chicks that sense of security which the body of Old Biddy gives them. Now put your cotton filled pad in place. The heat of the chicks themselves creates the necessary and yet the cotton pad allows the necessary circulation of air. Raise or lower this pad to increase or decrease the heat. If the chicks are too cold or too warm they will soon let you know by their complaining chirps. Five minutes will tell you this. If you don't hear the complaint by then, it is right, and let it alone. Every five hours let them out to feed. Give the last feed at night before going to bed. Keep this up for two weeks in mild weather and three weeks in colder weather, and your need of any brooder, oil, stove or fireless, is past, except at night. No bother with one or two going in at one time and getting chilled as Mr. Ashbrook described. What they need up to now is sleep and rest and just as soon as their hunger is satisfied, back they go into the brooder all at one time.

At the end of three weeks in cold weather or two weeks in mild weather, the chicks have now developed past the age when they chill easily and it is time for them to go to their new home outside. You can build a coop yourself for from \$6.00 to \$8.00, an ideal coop for raising young ones, good for many, many years without another dollar of expense. The coop is nothing but a glass fronted box 3x6 feet, 1 foot high with a tar paper covered hinged top and a stick notched to keep this top at any desired height. Under this top, resting on cleats, is a frame half covered with wire netting of one inch mesh and the other half with a muslin cover, the muslin end covering the feeding portion of the coop. The inside, from side to side, is partitioned in two by a board partition with a hole cut four inches from the top so the chicks can pass from one part to the other. One end has a board floor raised two inches from the ground. Put extra dirt in the other end to raise the ground part even with the board floor. This prevents dampness in both ends.

THE FEED

In the floored part, spread evenly first half an inch of growing grain food. Cover that with an inch of either hay seed or short cut alfalfa. Then comes two more layers of the growing grain food and hay seed or alfalfa. Fill your hoppers with the growing mash, grit, charcoal and water, and your feed troubles are over until it is time to drop the growing feed and substitute the regular feed—except to keep water, mash, grit and charcoal receptacles filled. Now bring out the chicks. According to the weather, they are now passed the delicate period and also past the danger of over feeding period. Put them in the coop and take away the brooder.

They wouldn't use the brooder if it was there, heated or not. No matter what hour of the day you look at them you'll never find them still a minute. They never give themselves time to get chilled. You'll see them eat, eat, eat and scratch, scratch, scratch in a way will do your heart good. And what is more, you'll see them grow unlike any heat pampered chick you ever saw. And when evening comes, they'll all gather in one spot. You are home from work then. Ten minutes and you have them in the brooder and carried into the house. Not by ones or twos, but all together, cozy and warm until morning.

How To RAISE BABY CHICKS

Put Avicol in the drinking water

Most people lose half of every hatch, and seem to expect it. Chick cholera, or white diarrhoea, is the cause.

An Avicol tablet in the drinking water will save your chicks from all such diseases. Within 48 hours the sick ones will be lively as crickets.

Mrs. Wm. May, Rego, Ind., writes "I was losing 10 or 15 chicks a day from diarrhoea before I received the Avicol. I haven't lost one since."

It costs nothing to try Avicol. Use it either for preventing or treating white diarrhoea and all bowel diseases of poultry. If not satisfied, your money will be promptly refunded. Sold by most druggists and poultry remedy dealers, or mailed postpaid for 25c. Burrell-Dugger Co., 407 Columbia Bldg., Indianapolis, Ind.

RHODE ISLAND REDS

Best All Purpose Breed

They'll make you more money than any other poultry breed. Egg laying contests show Rhode Island Reds lay more winter eggs, larger eggs, than any other breed. They mature quick, begin laying early. Rhode Island Reds combine egg and meat qualities in highest possible degree. Make best market fowls. Hens make excellent mothers. Most beautiful, most popular breed today. Ideal fowl for farm or city lot. We tell you where to buy.

Rhode Island Red Journal Only Journal in World devoted exclusively to Rhode Island Reds. Tells how to make big money with them—how to buy, sell, get greatest pleasure, most profit—everything you want to know about Rhode Island Reds. Published monthly, 50c year—3 years \$1.00. "Blue Ribbon Reds" remarkable book tells how to judge, mate, cull, feed, prepare for show, incubate, etc. Gives free with 8-year subscription to Rhode Island Red Journal, at \$1.00. Send dollar bill today.

KILL LICE ON POULTRY

with PINCH-DIP

Can be used in dry form as powder or mixed with water for dipping. Pure chemical. No adulteration. Every bit of it kills lice. 75 cents pound by mail postpaid. Agents wanted. Home Products, Inc., Rahway, N. J.

Why not try it? Once tried you will never bother with the old way again. Simple, easy, practically no work at all, the first expense the only expense and better, healthier, stronger chicks than by any other method. I averaged 360 chicks a year in this manner, selling them at three months of age. I did it all on a space of ground just large enough for three Philo coops with paths between. And I have never lost a single chicken by disease. Rats killed some before I began to also put wire netting a few inches below the ground part of the coop. I killed several by slamming the lid down on them when they tried to fly out. But by disease—not one single one. Can Mr. Ashbrook say as much with his heated brooder? I have started dozens of doubters raising them in this way. All succeed and would never raise chicks in any other manner.

Standard Revision Calls for Standard Improvement

(Continued from page 470)

A word further concerning judging. It is understood that comparison of competing specimens is the only conclusive way to determine comparative merit. The word "comparison" has general acceptance as the appropriate terms to express the method; it would be difficult to find one more appropriate. But another element, which might be expressed as intuitive perception of merit comes with the work of the expert appraiser of Standard values. I recollect an incident in the course of long argument some thirty years ago over the change from scoring to comparison, and the active part I personally took in the controversy. N. D. Forbes of Connecticut had made the assertion that "the judges of art collections, as oil paintings, must have some method of scoring to determine the prize pictures." I applied to R. Swain Gifford, through the medium of a mutual acquaintance, as to the method used. I learned that the judging was commonly the work of a committee, who worked independently first, and having gained their several personal impressions, a discussion of the merits of the pictures under consideration followed and prevailing opinion then decided the contest.

Expert judgment in all phases of art, whether pictures, oratory, music or animal life are the subjects of consideration and a matter of intuitive perception. It is not essential that each be brought individually and compared. But the influence of years of preparation for his work endows the competent judge with capacity to form an impression intuitively. The time arrives when mechanical aids must be laid aside, as when the grinder of a telescope lens, having proceeded as far as measurements avail, continues with the sense of touch alone to perfect his work. The judge should know all that the expert breeders know, and then some. Have we many such? Scales of point, score cards and rules will not take the place of keen observation and study in making more good judges.

VALUE OF CRITICAL SHOW REPORTS.

It has been observed by some writers that advancement in literature and the fine arts can progress no faster than intelligent criticism of the same. This principle holds true in the fancier's line of work. It is safe to say that the editorial reviewer of exhibitions, in his capacity as critic, holds a most influential position. Our leading exhibitions comprise each season the chief events of interest to all fanciers, and the write-up of the same, if done by one well fitted for his task by long study, becomes a most potent power to advance a breed's best interests.

The point I desire to make has to do with the problem of the judge's training for his work. When Mr. Hewes advocates score-card training as a proper foundation for a judge's career, I can only feel that he could state the case better by saying that the young judge should bring to his work familiarity with not one breed alone but many, should know not only poultry but possess the liberal education (not necessarily of the schools) that will enable him to be progressive. I can imagine no better preparation for a judge's career than a course in poultry journalism, interviewing breeders and judges, backed up by actual breeding experience. I believe that in the golden age of poultry now rapidly shaping, the poultry judge's profession will come to be a highly honored and remunerative one and that those who would qualify satisfactorily must undergo as broad a training for the work as if fitting for the musical or art critic's position.

The question of the admission of breeds and reduplication of varieties under variation of style of comb, has come of late to be a live issue. Several contributors seem more inclined to consider their personal privilege than the effects upon the industry at large

Raise ALL Your Chicks

After the trouble and expense of hatching good chicks, you want to raise them all—into heavy layers and husky breeders. It's a lot cheaper to raise them than to replace them even if you had the time. So take no chances—give them the start that will make them sturdy and keep them growing—feed them the original, dependable "baby food for baby chicks"—

Pratts Buttermilk Baby Chick Food

Should be fed for the critical first three to six weeks, because it contains exactly what the delicate little bodies need, for building bone, muscle and feather. Start with the first meal and count on it for results in husky, well-developed youngsters that will continue to grow to profitable maturity.

Used every season by thousands of successful chick raisers, because it raises the chicks, relieves you of danger, worry and loss. Depend upon it for your chicks—try it at our risk.

"Your Money Back If YOU Are Not Satisfied"

of too large a program. One enthusiastic advocate of rose combs would engraft that style of headgear upon everything wearing a single comb.

That unfortunate precedent of the admission of the Rose Comb Leghorn has borne a most prolific crop. The Leghorn females of that day wore combs as large as the males of today and the males' combs were of corresponding size. And whatever the force at that time of the utility argument as regarded freezing of those big old-fashioned combs, later developments have disproved, as the Leghorn of our egg farms is overwhelmingly of the single comb type. I think the inevitable outcome of this multiplying of breeds will be to drive the single comb and rose comb types into a single class, as is frequently done in English shows.

BODY SHAPE VS. TYPICAL SHAPE.

I believe I may safely bring the charge that the Standard is in its design and execution essentially superficial, and this upon several distinct counts. First, the descriptions of breeds have to do with plumage contour, the visible shape as expressed by plumage solely. In no case is reference made to the character of the physical body, of the flesh beneath the feathers. I presume that good judges do handle the specimen with the aim to base judgment in part upon proper physical traits. The Standard, however, nowhere hints at any such sanction. Herein lies the justification of all the criticism at the hands of practical poultrymen.

We have only to supply to breed descriptions such specifications as will enjoin the judges to consider typical physical traits peculiar to each class of poultry.

Our superseded (in practice) scales of points assigned the importance of plumage—exterior shape and color of some value upon an average 50-50 basis. If we should instruct our judges to estimate a similar comparative importance to the physical body and its covering we shall resolve our difficulties with the practical breeders.

SIZE AND TEXTURE OF INDIVIDUAL FEATHERS.

Count No. 2 of superficiality in the Standard relates to plumage in the ignoring of the character of individual feathers. Under a consistent Standard no pullet with curling cushion feathering could win over one with proper feathers. Narrow wing feathers would invalidate the specimen's chances.

If I should carry the charge of superficiality still further and apply it subjectively, it would perhaps be a fitting rebuke, and fanciers are probably no worse than poulterers. "Eggs is eggs" well might serve as a slogan for our experiment stations. Leghorn is trumps; and laying contests are managed under conditions which place emphasis upon eggs to the disregard of meat. After all this egg propaganda they exploit rabbits as a source of meat!

An inconsistent feature of the Standard relates to the unequal representation of breeds as to illustrations and preliminary treatment at heads of breed chapters. In some instances the history of a breed's origin is attempted; sometimes incorrectly, as in the case of the Wyandotte, which had become a breed with fixed characteristics long before its sudden boom had set experimenters to work with Hamburg-Brahma crosses. Yet these crosses are assigned in the Standard as the breed's foundation stock, "proven," as asserted, by the test of resemblance. If the history of breeds deserves a place in the Standard, which may be doubted, it should be authentic and consistent in application. The Dark Cornish is favored with a surmise as to its very shady origin. The white-laced red variety, which is one of the few instances of the positively known origin of a breed, is ignored in this respect.

The superficial nature of our Standard is no more forcibly displayed than in its lack of reference to the character of the individual feathers. As water cannot rise above its source under the impulse of gravitation, it is a theory held by many judges that nothing not specified in the text may be read into its provisions. The physical character of the feather is an unmistakable expression of the character of the bird within. But in the lack of specific requirement to this contrary, a weak and narrow feather goes, so that it carries the prescribed color. As our Standard, ("so thorough, accurate and far-seeing") has always ignored the character of the bird itself in favor of the external appearance of its feathery envelop, so it ignores likewise the element of sturdiness or vigor as indicated in the structure of the individual feathers. One of these days a judge will arise who will "dare to be a Daniel, dare to stand alone" and topple down our house of cards. This project of a utility standard is but the national outgrowth of such superficial methods in Standard writing. Personally speaking, I care little for contemporary criticism, but I have

Sound Business Prevents Losses and Adds to Profits

THERE'S sound business principle in preventing losses. A large part of a season's hatch must go toward paying expenses. Every chick sold above that means a profit. Every chick that dies above that fixed number represents a loss of profit.

The brooder that raises the largest number of chicks is the one that makes real profits. Hundreds of thousands of users all over the world have learned by experience to place their reliance on

BUCKEYE COLONY BROODERS

Because they are right in scientific design, perform to perfection, prevent crowding, overheating and chilling. In them every chick gets just that amount of heat and protection essential to quick, sturdy growth, selecting by the sure guide of instinct precisely what it needs. The result is health and strength.

Success Follows

Buckeye "Colony" Brooders have thus revolutionized the raising of chicks, saving many thousands every year, making three chicks grow where one grew before, reducing the losses to insignificance, the expenses to half and the labor to a fourth. Success is sure to follow their use.

Supplied for coal, gas or oil, under a guarantee of absolute satisfaction or money back in thirty days. In fact, any purchaser may write his own guarantee of what a brooder should be and do and we will sign it.

Buckeye Lamp Heated Brooders care for the smaller lots with equal success. Wherever a brooder is needed, satisfaction will follow the use of the Buckeye.

Get These Reasons

Full descriptions with the reasons set out for the unqualified success of the Buckeye Poultry Raising Equipment are found in our new booklet, "The Revolution in Poultry Raising," which is invaluable to every chicken raiser. Any one of the more than 15,000 Buckeye dealers in all parts of the world will be glad to supply this and point out the advantages of Buckeye equipment, or we will mail a copy free from any of our offices on request. Ask for it today.

Personal and Courteous Service

USE ANDERSON BOXES

a consistent regard for the opinion of the future. What will our poultry interest look like a couple of generation hence, in the light of the advancement that will have been reached?

As a breeder whose main interest centers about the Barred Rock, I wish to direct attention to one particular absurdity in its Standard, viz., "the combination of overlapping feathers giving the plumage a bluish appearance." And in another place, "the overlapping of the feathers producing a bluish tinge when viewed under certain light reflections." This description of a surface color effect to the influence of feathers lying underneath has remained unchallenged through several editions. I would inquire by what recognized principle such a claim is founded? Do the underlying feathers in the case of the Laced Wyandotte contribute to mossiness of the centers?

We distinguish color of an object according to the character of rays not proceeding from its interior, or bodily substance (save in the case of molten or heat-producing bodies) but the light reflected from its direct surface. How a barred feather can take on color influence from other feathers which from their position are protected from the light is a proposition which challenges the credulity of inquiring minds. I am aware that weak specimens often display abnormally thin feathers, but I cannot believe in this "overlapping" theory as a source of color effects.

Successful Management of Incubators

(Continued from page 471)

An even flame under control needs attention only twice in 24 hours. The size of the flame is reduced in hot weather by clipping the corners from the wick.

A greater number of eggs will go into the tray when placed irregularly, than when in rows. The proper position for eggs is on their side, but if either end is uppermost it should be the large end that is up and not the small end.

After first placing the cool eggs in the machine, it may be 24 to 36 hours before normal heat is resumed. This gradual warming of the eggs is beneficial, for the germs may die during the first three days if a degree or two of overheating occurs during that time, for the vital germs are destroyed during the first week in a temperature that may not be injurious at the close of the hatch. Therefore, warming the eggs hastily or overheating them should be avoided.

The eggs should not be turned during the first two days; the trays should simply be drawn from the egg chamber, reversed and put back. Should there be two trays in the machine, they ought to be both reversed, and changed from side to side so as to equalize the heat as it plays on the eggs in the egg chamber. Between the second and nineteenth day the eggs must be turned twice a day, morning and evening. For the first week the turning of the eggs cools them sufficiently. After that time they should be permitted to cool once a day.

During the second week, if the temperature of the room is below 60 degrees F., they should be cooled ten minutes; if the temperature is above 60 degrees F., they must be left to cool for 15 minutes. At the beginning of the third week, the eggs should be cooled for one-third longer. If the temperature of the room is around 45 degrees F., the eggs will not need any more cooling than what they will get in turning. On the evening of the nineteenth day the door should be opened, and the egg chamber aired, but do not remove the trays. After airing, close the door, and do not open it again until the hatch is completed.

It is a good plan to test the eggs on the seventh day, and again on the fourteenth day, and to remove all infertile eggs. I always plan to have a few hens to set at the same time. I set the incubators, so as to have their fertile eggs to replace the infertile eggs in the machines, and in this way keep the trays full, for if one tests many eggs out of the incubator and does not have eggs to replace them, when the trays are handled for turning and cooling, the fertile eggs will roll around the jar injuring the hatch. When I do not have any hens that want to set, I have a 50-egg incubator which I use for replacing the eggs removed from the larger machines.

No Guesswork About FUL-O-PEP Feeds

9 weeks old,
weight 3 lbs.

White Rock
Pullet, 2½ lbs.
at 9 weeks.

The Ful-O-Pep Strain of Buff Orping
tons, bred and owned by us.

ALBERT ANGELL, JR.
Write our Poultry Expert
about your poultry troubles
—he will gladly assist you.

NO doubt it will be of interest to the poultry fraternity to know that aside from manufacturing the Ful-O-Pep Line of feeds, we are also in the poultry business ourselves. Naturally we are in a position to know not only what Ful-O-Pep Feeds will accomplish but also what can be expected from all other formulas. Therefore, there is no guess-work to Ful-O-Pep Feeds." We do the experimenting for you.

It is our desire to have the greatest line of poultry feeds that can be formulated and manufactured. So far, we know that our aim has been realized in the Ful-O-Pep Line as offered today. If the time arrives when it is possible to improve either our Ful-O-Pep Chick Feeds, Ful-O-Pep Growing Mash, Ful-O-Pep Scratching Grains, our poultry feed patrons will be given the benefit of such improvements.

In the meantime, the experiments which we are conducting in our various pens coincide with the thousands of testimonials we are receiving each week from satisfied feeders of the Ful-O-Pep Way.

When it is possible to make a better feed we shall do so.

The Quaker Oats Company

Poultry Dept. A. P. J.

Address: Chicago, Ill.

Zeeland Pullet Farms

Find the **FUL-O-PEP** Way

At left, A. A. Van Horn; at right, H. B. Mulder, owners of Zeeland Pullet Farms.

Successful Poultry Farms Practice The **FUL-O-PEP** Way

The old fashioned and impractical way of mixing feed at home is a thing of the past—in fact, is obsolete. It has given way to the more scientific and commercially manufactured ration. Take in the case of the Wyckoff Poultry Farm at Aurora, N. Y., and again in the plant of W. D. Holterman, Fort Wayne, Indiana. These large and prominent farms owned by two of America's foremost poultrymen have long since discarded home formulated mixed feeds and are not only saving time and labor by feeding the Ful-O-Pep Way, but are also obtaining greater growth in the young stock, with larger returns in egg production on a much less consumption of feed than when home made formulas were used.

The Zeeland Pullet Farms at Zeeland, Michigan, have just advised that in their business of supplying two and three months old pullets they follow out the Ful-O-Pep Way to the letter just as described in our Poultry Calendar book.

The **FUL-O-PEP** Way

White Leghorn pullet 5 months old. A specimen of the stock grown and sold by this great pullet farm.

Another view of poultry yard at Zeeland Pullet Farms.

A bunch of lively Ful-O-Pep chicks.

Another view of Zeeland Farms showing bunch of White Leghorns.

The Profitable Way to Raise Pullets for Market

Best Method Known for Producing Well Developed Stock

Following the Ful-O-Pep Way, they tell us, insures the birds being properly raised so that they can guarantee to their customers birds which will give an entirely satisfactory account of themselves in egg production.

The Zeeland Pullet Farms are the largest in the entire country, making a specialty of supplying these two and three months old pullets of the Leghorn and Ancona Breed, thus the beginner as well as the more experienced poultry raiser by purchasing these pullets raised the Ful-O-Pep Way has but two months or so to go before they will commence to make returns in egg production.

When you buy either eggs for hatching, day-old chicks, or better still, these two and three months old pullets, from the Zeeland Pullet Farms and known that they have been produced the Ful-O-Pep Way, your success as a poultry raiser is assured.

—It Always Pays

Delivering a load of Ancona pullets to market.

Ancona pullet, age 4 months and 13 days—and laying. The grade of stock offered by Zeeland Pullet Farms.

Range at Zeeland Pullet Farms.

Part of the Zeeland Farm flock at Fair View, Michigan.

A bunch of White Leghorn pullets—age 4½ weeks.

Raise 'em The FUL-O-PEP Way

The Ful-O-Pep Way of Feeding chicks has changed the old expensive "grain feeding way" and has proven to poultry raisers that the old method of grain feeding is all wrong. The Ful-O-Pep way of feeding

Gives You 1 Pound of Gain at Cost of 2 Pounds of Feed

instead of only 1 pound of gain to each 4 pounds of feed, which is the basis of figuring cost of production arrived at by experiment stations covering several years experiments with grain feeding. Why continue to feed this old expensive way when the Ful-O-Pep Way will give you the same gains with only half the feed?

FUL-O-PEP GROWING MASH

Costs Less Per Pounds of Gain Made Than Any Other Feed

The Ful-O-Pep Way consists of feeding Ful-O-Pep Growing Mash from the very start—continuously keeping it before your birds all the time. Ful-O-Pep Growing Mash, because of the high feeding value of its Oatmeal, fish and bone contents goes twice as far as green feeds—every ounce is digested by chicks delicate digestive organs—there is no waste and when compared with results, costs only half as much in pounds of feed consumed for gains in pounds of meat produced. Furthermore, your losses from bowel and digestive troubles that arise from feeding hard, indigestible grains, will be very much less and your flocks will be of even growth and development. Give the Ful-O-Pep Way a trial this season—it will reduce your feed costs and materially increase your profits. Your dealer can supply you. Write for Free Ful-O-Pep Poultry Calendar—learn all about the Ful-O-Pep Way.

Is She Laying Or Not?

**A—Who has large fingers
says "No."**

**B—Who has small fingers
says "Yes."**

**C—Who has average size fin-
gers says "Doubtful"**

What is to be done when "Doctors" disagree? Every hen has certain pronounced characteristics which determine her laying condition and capacity for large or small production, as well as general purpose and meat qualities. How to tell these signs with accuracy is uncertain if not impractical by the well known and so-called "finger method." While all authorities agree on the principle of this method of testing, many poultry keepers do not secure the same results from the same hen. The theory is correct, but the method uncertain.

Albert Angell, Jr.,—the poultry expert of The Quaker Oats Company, Address Chicago, Illinois, has made a thorough test of the finger method of determining the good layers from the bad—covering a long period of time, in which hundreds of known producers and non-producers were used and tested by many different sized fingers of as many people. Mr. Angell, as the result of this experiment has invented and perfected an instrument which he calls "The Angell Hen Tester"—and is now offering it for sale by The Quaker Oats Company, Poultry Dept., Address, Chicago, Ill., as a means of culling with certainty.

The Quaker Oats Company has also just published a book by Mr. Angell, in which the story is explained in detail—the name of this great book is "How to Know Profit from Loss." It is sent postpaid with "The Angell Hen Tester" for \$1.50, and will be worth many dollars to every poultry keeper. Order one today.

Bad odors and smoking lamps are often due to poor oil, and unless this fault is remedied the hatch will be spoiled. Imperfect lamps, short wicks, or wicks that are filled up in the web are also serious obstacles in artificial incubation. The best obtainable lamps and wicks are sometimes faulty and if they are defective in any way they render the keeping of an even temperature difficult or impossible. An even heat current cannot be maintained unless the incubator is level on top. Flues that are clogged with soot fail in heating. Oil-covered lamps soil the hands. Handling or turning of eggs with hands that are soiled with oil destroys the embryo in the shell. Too much haste in warming overheats the eggs and kills the germs. A sudden jar of the incubator separate the yolks in the eggs and the chick promptly dies. If the eggs are left out to cool until they become chilled they will not hatch well. Lamps irregularly filled, carelessly trimmed, and allowed to burn too high or too low, assure failure, as will also neglect in turning and airing the eggs. If the operator neglects the eggs in the incubator, failure is as certain as it is when the hen neglects her nest.

Selective Breeding In Reds.

This is the time of the year when the back-lotter begins to think of improving his flock. He has taken in a show or two and has a better idea of what the big breeders are striving for.

On looking over my own Rhode Island Reds I found that I had gone as far as I could with the material I had. For me to buy a cockerel was out of the question, as I wanted to buy in the same strain, and the real birds cost real money, and are worth it; so I set out to buy a hen.

I had been breeding for type for two years so my breeding cockerel was fixed for that, with the exception that he carried his tail a little high; and like most Red cockerels is a little light in his hackle feathers. He was a great strutter, so carried his head high which did not give his back a horizontal position. He also had a little black in his wing.

I wrote to the breeder from whom I had gotten my start and stated how much I wanted to pay for a hen, then described the cockerel which I had to breed. I also sent him a few feathers from him. What I wanted in a hen was a good sound neck, breast and fluff, with good undercolor, and red wing. I also wanted long coverts that would reach out on the tail to hold the tail down and give width to the back. This I have noticed is what the Leghorn men do and the breeders of the American breeds are following in the footsteps. I figured that a hen with this kind of tail was what I needed to match with my cockerel.

The new hen arrived and had all the points I asked for and then some that I had not asked for, so it looks like I will breed my low tails and keep my type and width of back with an improvement in undercolor.

Now, the thing that worries me is how to get a color in the neck of my cockerels that is a few shades darker; but I have a year or more to think of that—and that is what makes the chicken business so interesting.

My experience has been, that if the back lotter will describe his bird to the breeder, what points he wants to improve and the price he is willing to pay he has a better opportunity of getting what he wants.

Illinois. Chas. J. Gantzer.

Hodgson Baby Chick Houses Every Time For Brooding 250 Chicks or Less

**Handsome, economical and efficient
beyond anything else on the market.**

"I have used one for two seasons and have never taken a dead chick out of it. Have had it on side lawn in a blizzard with mercury at zero, and found thermometer exactly the same in the morning as when left at nine P.M. All my chicks are pedigreed from heavy laying dams and of great value, hence the importance of careful brooding to insure the least possible loss."

Herbert A. Daniels, Grafton, Mass.

"I like the 'WIGWARM' better than any brooder I have ever used. In severe weather it did not burn over a pint of oil in 24 hours, and in moderate weather about one half pint, and supplied ample heat and ventilation. It was run out in the yard with no protection when the ground was frozen and during snow-storms."

A. S. Briain, Mt. Kisco, N. Y.

"All my pedigreed White Rocks are raised in Wigwarm Baby Chick Houses, and the majority of them mature in 5½ months. This I attribute in no small degree to the start they get in your Chick Houses. The system of forced fresh air ventilation is really wonderful, and means the utmost vitality for every chick."

Harold F. Barber, Dover, Mass

"In my seven years' experience I have used four makes of brooders and I have found in the 'WIGWARM' just what I have been looking for. In each of the four brooders I bought from you I put 60 chicks and had only two fatalities in the whole 240. They were put in the brooders on April 19, one of the wildest and windiest days I ever knew on Long Island. The second time I put 72 in each brooder with no losses."

Mrs. A. Mack, Brookhaven, L. I., N. Y

A Colony Brooder and Brooder-House combined. With the HODGSON BABY CHICK HOUSE you have NO coal stoves, NO brooder houses, NO cold corners, NO crowding, NO chilling, NO dead air for the chicks to breathe. Chicks raised the HODGSON way are healthier, mature quicker, and show more profit than those brooded by coal stove or box brooder.

Steady Heat — No Fumes — Little Oil — Fresh Air Always

Hundreds Of Dollars Given for Poultrymen's Opinions

THE subject of how to raise chicks is such an important one, that we believe a book devoted entirely to this subject, giving the methods and experiences of practical poultrymen would be a valuable addition to any poultry library.

In this new book we intend to compile the experiences of poultrymen with H-O Steam-Cooked Chick Feed, and will give several hundreds of dollars to poultry raisers whose letters are accepted for publication.

H-O Steam Cooked Chick Feed has been found so valuable in reducing chick mortality and in making chicks grow and develop in record time, that these experiences should be of great value to poultry raisers everywhere. The conditions which govern the selection of the material which will make up the book are very liberal, so that every poultry raiser will have an opportunity to secure a prize, and get his experiences in print.

If you are interested, write for full information, at once, addressing

The H-O Cereal Co., Inc.
Desk 10 Buffalo, New York

H-O STEAM-COOKED CHICK FEED
Saves the Lives of Baby Chicks

Strawberries a Most Profitable Crop

No fruit crop gives such a large financial return as does the strawberry. The net profit per acre, when all cultural and other requirements are given the plants is so large that a very few acres thus planted yield a competency to the careful thoughtful, thorough grower.

The growing of strawberries for commercial purposes is successfully conducted in practically every section of the United States. This plant has, like all other fruit plants and vines, its favorite soil and climatic condition. It is, however, a universal fruit. Specialists in the origination of varieties of strawberries have given us such a large number of varieties that no matter what character of soil we may have a sort to fit that particular soil is easily obtainable.

No other variety of fruit is in such a popular demand. The market everywhere demands more extra choice strawberries than it secures.

The strawberry is a quick money getter for the grower. Plants set out in the spring yield an abundant crop the next season. There is not a long and expensive waiting that the grower of the other fruits must experience. It is a common experience that one crop of strawberries pays the purchase price of good land upon which the fruit is grown.

It is a crop which appeals to every man and woman who has home ground. The home strawberry bed is an essential. What fun it is to go out and pick the great big red beauties and thus have them in all their glory of bloom fresh on our table. Any man who can go out and pick a number of boxes of strawberries before breakfast and place them on the table for wife and children will have in his soul and heart the song of the birds and the joy of one who communes closely with the God of nature. I have always maintained that there are three things which are essential to the happiness of a household—a strawberry bed, a fireplace and a bath tub.

In the very fitness of things the strawberry bed has its place on the farm and suburban home. This, because of the exceedingly large and speedy financial returns the growing of the berry returns, and for the farther reason that the time of marketing fruit is very short and thus does not interfere with the other operations on the farm. The growing of the strawberry and poultry on a few acres of ground ought to strongly appeal to thousands who are now residents of cities. For a large number of men and women living in the city life is becoming more difficult each year. Here, for these men and women, life is hard, strained and unnatural. It is impossible to build and maintain homes that are as homes should be so long as they remain pieces of the big grinding, never resting machinery of the

city. I know of no more ideal condition for the building and maintaining of a home than the small farm, devoted to the growing of strawberries and poultry. Here the reward of earnest effort is certain. Here all that is best in life can be had, and here is the best place in all the world to build the home, to rear the children, to secure a just compensation for the daily toil, and place aside, safely, a competency which will cover all the wants of advanced age. It does not require an abundance of capital to embark in commercial strawberry growing. The cost of plants sufficient for the planting of an acre of ground is comparatively small. Cultural expense and the cost of other features of production are not large. The net returns from the strawberries will carry all the operating costs of the farm and allow for payment of land that be necessary.

Thos. F. Rigg.

* * *

How are condition for apples, small fruit, vegetables and poultry raising in Northwest Alabama in the Muscle Shoals district?

I am like hundreds of others—followed public work until I am too old to stand the pace, and have not money enough on which to live the balance of my days. Lived on a farm until I was twenty. Am going to try it again in a small way, if I can find a place to suit. I bought here and got stung.

Florida.

F. C. Bly.

The climatic and soil conditions in the part of Alabama to which you refer is favorable to the production of apples, small fruit and vegetables, also for the profitable raising of eggs and market poultry. There are good markets near at hand. There is a long growing season and a fruit and poultry farm in that district rightly managed should prove profitable.

* * *

Is it possible to move full grown apple trees?

J. H. Jones.

Illinois.

Only in exceptional cases should full grown apple trees be moved from one location to another. Of course this can be done if extra care is taken in the operation. It is best to remove such a tree in the winter, taking with the roots a very large amount of earth. Apple trees for a commercial orchard should be planted at least thirty feet apart. For the home yard they may be planted closer.

* * *

Am considering purchasing some land in North Central Minnesota in Southern Aitkin County, as I understand this is a newly settled country in the cut-over hardwood section.

Land is quite reasonable, and I would like to know if it would be wise to go into the poultry business there. Would also like to know if the Henry Clay and Delicious apple would be successful there. Am a young man of 30, in good health and have a wife and three small children; wife and I are willing and anxious to work.

Wyoming.

Fred L. O'Connor.

North-central Minnesota is mainly a small fruit section. Poultry is profitably raised on the farms throughout the entire state. Henry Clay and the Delicious apples are heavy enough for successful planting in the section in Minnesota to which you refer. A combination of poultry and fruit as a side line to general farming would prove profitable.

HERE'S THE MOST *Liberal Offer* We Ever Made!

H. E. Beatty
PRES.

Send No Money

I WANT every reader of this paper who has a few square feet of ground, up to an acre or more, to take advantage of this—the most Liberal Offer we ever made on the WORLD FAMOUS KELLOGG PEDIGREE STRAWBERRY PLANTS. Home-Made Brooder Best

The best brooder obtainable will cost you less than \$5.00. Ask your dealer for a Putnam Brooder Heater, price \$4.75. Plans for making a complete brooder are packed in every heater. Hammer and saw are the only tools you need. This home-made brooder will require less care and raise stronger chicks than any brooder you could buy, regardless of price. Read the complete story of the Putnam Home-Made Brooder on on page 520.—Advertisement.

BEES AND CHICKENS

A Good Poultryman has the same qualifications that make a good beekeeper. Bees and poultry go splendidly together. Easy to learn. Inexpensive to start. Very profitable. Let us tell you how out of our 50 years' experience. Write today for handsome free booklet, "Bees for Pleasure and Profit." Tell us your occupation and home location so we can better advise you. This month is the time to get ready.

The A. I. Root Co., 444 Main St., Medina, Ohio

Free-Conkey's Poultry Book

80 pages chock full of information about the feeding and rearing of chicks, culling of hens, etc. Tells how to keep chickens healthy and how to make them pay. Whether a beginner or a professional, Conkey's Book is worth dollars to you. Sent for 6 cents in stamps to pay postage.

THE G. E. CONKEY CO. 6531 Broadway, Cleveland, Ohio

BEES PAY TREMENDOUS PROFIT. Start with a few colonies. We sell pure bred, record breaking, gentle, Italian bees. Young colonies in new 10-frame hives \$15.00. Young colony without hive \$12.00. May delivery. Order direct. References: Editor A. P. J. Bee supply catalog free. **IOWA MODERN APIARIES, Box 7, Waterloo, Iowa**

SPRAYING THE HOME GARDEN—a 28-page book based upon 35 years' experience—tells in simple way how to protect trees, shrubs, vines, flowers, vegetables, from insects and diseases. Teaches the *keeping well and making well* of plants. Sent prepaid for 4c in postage. Address: **Dep't 21 B. G. Pratt Co., 50 Church St., New York**

Would you please advise me as to what would be good to plant in my chicken runs for shade, fruit trees or smaller fruits, such as raspberries or gooseberries. The soil is a very sandy loam.
Utah.

Mr. O. Cramer.

I advise you to plant plum trees in the poultry yards. The plums seem especially adapted to such use and afford splendid shade to the poultry.

A friends and I are interested in grapevines, blackberries and black currants. I have about two acres which I expect to plant in fruit in about two years and have a great many old plants of the three kinds above mention. I would thank you for your instructions as to the cutting of these plants for young planting and what time to cut. I have rooted a great deal of vines while on the main plant by covering them in the ground, but it is so slow in getting results.
Ohio.

Henry Allison.

In the propagation of grape vines made from cuttings it is best to make these cuts from the parent vines in the fall. Cut pieces to about three buds, wrap in bundles and bury about two feet deep. In the spring as soon as the condition of the ground will permit these cuts should be planted in nursery rows, the cuts about one foot apart in the row and the rows far enough apart to permit good cultivation. In a year these cuts can be permanently planted. This same practice should be used in the cutting and planting of currants tips.

Blackberry plants always make a large number of suckers which can be transplanted in the spring. A better way is to lay down canes of blackberries in the spring. From each plant a bud will form and these can be set in the permanent place the following spring or fall.

I would appreciate your opinion on the enclosed folder. We want to get an apple orchard started and this might be one way of getting it as we cannot afford to buy trees now, so want to know what you think of these root grafts. Can quince trees be planted here?

Indiana.

Mrs. R. Peters.

It is not advisable to plant apple root grafts. One must have had experience in handling this root graft to bring them to successful growth. The better way is to purchase one or two year old apple trees. You will gain time and find it to your financial advantage not to plant these root grafts.

The best peaches are Stark's Early Alberta, Alberta, J. H. Hale and Krummell.

The orange quince does fairly well in your state but should not be planted in a commercial way.

I have always been interested immensely in the poultry and fruit business, especially the poultry business, in all its different branches. Now I can truly say that I know the business, as I have raised small flocks and studied various poultry journals, also taking a course in the Nebraska School of Agriculture. I am a young man of 19 years of age and have a half year in high school as yet. I will finish that, but after that—?

I expect to go back and locate at Stanton, Neb., as soon as I finish my school work. But I am so interested in poultry that I want to get a start as soon as I can. The place I am thinking of renting, as I could not buy it, as I have little capital to invest. I am taking over my brother's poultry this spring, and will stay with him till school begins again. The land comprises about ten acres, is just outside of Stanton, Neb., and the Upland Highway and railway run at the south side of it. The land is very rich and level, having been in alfalfa the past four years. There are no buildings on it, and I expect to put movable or portable houses on here at first. Then when I am in a position to buy the land, which is valued at \$500 the acre, I will plant trees on it and raise fruit. My favorite chicken is the S. C. White or Black Leghorn. I expect to install a large incubator and do some custom hatching for the farmers. I want to start a commercial egg farm. I know the location is good, as there are many poultry men around this town.

Sick Baby Chicks?

Germozone operates just as these people say. It is preventive as well as curative, and satisfaction is absolutely guaranteed. Twenty years on the market. Sold by drug and seed stores at most towns.

Wm. E. Shepherd, Scranton, Pa., wrote: "Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick." Ralph Wurst, Erie, Pa., "Not a case of white diarrhoea in three years." C. O. Petrain, Noline, Ill. "I never had a sick chick all last season." Mrs. Wm. Christiana, Olive Ridge, N. Y. "Have 800 chicks now 5 weeks old and not a single case of bowel trouble."

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock—for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers.

If no dealer, order by card. Postman will collect. No extra charge. Handy as phoning. 75c and \$1.00 pkgs. Baby Chick Book FREE.

Now, what I want to know is this: Should I rent this place and start out the way I said I would if the piece is rented, or should I wait and raise poultry for my brother until I am able to buy it? Then plant trees for the fruit farm and gradually build up and keep on working for my brother during this time, until I feel I am able to reach the financial point to take it over. I am all mixed up over this, maybe more from having too great an ambition. Your answer will be followed, as you ought to know best, therefore, I have come to you for help far enough ahead of time so I will not make a blunder. Nebraska. Emil Glaser.

I would like to place you in full possession of the fruit and poultry farm which you so much covet. But this I cannot do and perhaps it is well that I cannot. It is difficult to settle a question of this kind and perhaps an unwise attempt to do so. If the ten acres of ground to which you refer are especially adapted to the growing of fruit and poultry, and you have made up your mind to establish your home in that section of the country, it seems as though it would be a good business policy for you to buy this land and continue working on a salary until you have paid for it. You could plant an apple orchard on this land which would require but a short time each season for its care. By so doing the apple orchard would come into bearing when you were ready to take hold of the fruit and poultry proposition in a permanent way.

I know just how impatient you are to brush away all obstacles and be in full possession of this farm. The impatience of youth is on the whole rather a good thing, but patience is one of the lessons which we all must learn. I feel confident you will be able to work out the proposition in due time.

I wish to ask if you think we could make a little by going to Michigan and buying the poor grade apples and then taking a carload to the different towns and selling them in bulk from the car by the bushel? Do you think any one can make money this way? We are both hard workers and have only one small child. What part of Michigan would be best to go for this? Can one rent a small place in the fruit belt of Michigan on shares or for cash, say, ten acres for poultry with some fruit on it? Can we rent a small farm in Iowa either on shares or cash rent with everything on it? What part of Iowa is best for fruit, truck and poultry? This same question applies to northern Indiana.

Now, you have told me that Virginia was a wonderfully good state. What about the heat there? Is it so hot there that a northerner cannot work?

Give me an idea, for I have worked hard for what little I have and if I lose it I will be in bad shape. I will have a little money to pay after a while, but it seems slow, so we may have to rent. What kind of soil is it around Detroit, Mich.? Do you have to use a great deal of fertilizer?

Wisconsin. Mrs. A. R. Larson.

The buying of apples and selling them in bulk as you propose to do is rather an dangerous business proposition. I would not attempt it.

Many sections in Michigan are especially adapted to growing large and small fruit. Oceans County is especially adapted to this proposition. The fruit and poultry farms conducted in that county yield good returns. A very large per cent of successful commercial apple orchards of Iowa are located in the southwestern part of the state on the Clay land, bordering the Missouri river.

Northern Indiana is well suited to the Commercial raising of apples.

Some of the most profitable apple orchards in the United States are located at Piedmont, Va., and in the Shenandoah valley of the same state.

You have been misinformed as to the summers in Virginia being exceedingly hot. The summer season is of long duration, but the heat is not oppressive.

Planet Jr.

Keep the kitchen garden growing

When plowing, planting and early harvesting are pressing, a Planet Jr. No. 17 Single Wheel Hoe is a life-saver for the kitchen garden. Half-an-hour a day with this light, strong, quick-working hoe and cultivator keeps your vegetable patch flourishing and free of weeds. When man-labor can't be spared, a woman or boy can easily do all the garden work with a No. 17, so easily and lightly does it run. Soon pays for itself in just the labor it saves.

No. 17

Write for your copy of the Planet Jr. catalog, showing more than 55 Planet Jr. seeders, wheel hoes, one-horse and riding cultivators, etc.

"Didn't Lose a Chick"

A Remarkable Story of Success

MRS. ORTSEIFER
East Liberty, Pa.

"There is money in poultry when the right methods are followed—

says Mrs. S. J. Ortseifer of East Liberty, Pa., "And," she continued, "the National Poultry Institute has certainly shown me how easy it is to keep poultry at a profit." Mrs. Ortseifer is but one of the hundreds of successful poultry keepers who are enthusiastic in their praise of the "National" way. Her true story is interesting. Read what she says:

Our FREE Poultry Book Showed the Way

"Before I heard of the National Poultry Institute, I had very poor results with my hatches, in fact, they were almost a failure. After studying your interesting lessons on incubation, I quickly saw what to do. I then started another hatch in the same incubator with 80 per cent better results. My chicks used to crowd in the brooder and I lost quite a few in this way but after reading your lessons on brooding, I had no more trouble. In fact, from our last hatch, we DIDN'T LOSE A CHICK."

"We have also learned the importance of proper feeding.

Your lessons on feeding are easy to understand and put into practice. It is certainly worth a great deal to know how to feed chicks and handle them for early maturity and high egg production. We used to have mongrel fowls and from 17 hens we only got four or five eggs a day. After we started the National way and followed your wonderful feeding methods, we got from 11 to 14 eggs a day. We have since discarded the mongrels and replaced them with the best White Wyandottes we could get and they are the attraction of the whole neighborhood.

"We also tore down our old impractical poultry house and built a new one following your plans. You should now see our happy, contented fowls, busy every minute, scratching in the deep litter, singing and laying.

"And that is not all," said Mrs. Ortseifer, "the care of the flock has become a real pleasure by taking household cares and worries off my mind. Furthermore, my husband has become so interested that we are now looking for a few acres where we can raise poultry by the hundreds. WE FIND IT PAYS AND WE OWE IT ALL TO YOUR COURSE."

Others are doing as well as Mrs. Ortseifer—YOU CAN TOO.

The first step Mrs. Ortseifer took was to write for our FREE BOOK, "HOW TO RAISE POULTRY FOR PROFIT." This valuable book tells you many important facts on feeding, housing, culling, etc., and all about the WONDERFUL OPPORTUNITY FOR PROFIT FROM POULTRY. THIS BOOK IS FREE. WRITE US TODAY FOR YOUR COPY. THIS IS IMPORTANT TO YOU—IT MEANS YOUR FUTURE SUCCESS—AS IT DID FOR MRS. ORTSEIFER. SEND FOR A COPY NOW, TODAY. DON'T WAIT, A POSTAL WILL DO—BUT DO IT NOW!

The National Poultry Institute, Inc.
Dept. 111-A Washington, D. C.

Let The Hen Brood Your Chicks

Purchase rights to make and use Nature-Plus and say goodnight to your brooding troubles. Plans and rights sold to users under money back guarantee. WRITE TODAY FOR PARTICULARS.

NATURE-PLUS COMPANY

HILLSBORO, OREGON

The nights are cool and refreshing. I know of no more favorable location to make a home than in these sections of Virginia. In fact, I am more fond of those sections than I am of any other in the United States.

The soil in the vicinity of Detroit, Michigan is a sandy loam and adapted to the growing of vegetables and small fruits. Commercial fertilizer is used by all Detroit growers in that section.

I advise you to use the utmost care in making a change of residence or the purchase of land. As you say, a mistake in so doing would be disastrous and you should make a thorough personal investigation before making a purchase.

We are on a clay loam soil here and want to know which is best for us to plant this spring for winter feed for our purebred poultry, that is, mangels or sugar beets? Which will do the best here and keep best through the winter? Which will the poultry like and do the best on? Which variety of either of these would you suggest best to grow here?

We are also considering the growing of more fruit along with the poultry business, but would it do well without any bees on the place to cross pollinate and fertilize the fruit?

Pennsylvania.

H. W. Kuhl.

Would plant both the sugar beet and the mangels which will give the fowls something of a variety of vegetables during the winter. Each of the vegetables contain elements which are very beneficial to poultry.

While it is not necessary that bees be kept on a fruit farm, it is profitable to do so. Bees are a great agency in pollinating the bloom of all fruit trees and vines. I advise you to keep bees not only for this but because they are very profitable.

I bought a place with 4 1/2 acres of land and intend to plant some of it in fruit trees, berries and grapes. Will you please give me your advice what varieties are best adapted for my soil. The land is level and naturally ought to be well drained, but on account of no open ditches it is rather poorly drained, and after heavy rains some water stands in some places for quite a while. The soil is clay land; at 7 1/2 feet is hard pan. The land in the neighborhood is mostly rolling and a little hilly. I would like to have all kinds of fruit for home use, but do not care to plant anything that will not do well. Would rhubarb and asparagus grow satisfactorily on my land; and what kind of strawberry is best? What sort of grapes will give the biggest crop?

In the line of poultry what breed would do best on this soil. I intend to build a poultry house 14x20, open front, 5 feet in back and 7 feet in front, 2 feet above ground. This house has proved a good one. Will Leghorns do better on heavy soil than will American breeds?

Is red cedar rust harmful to apple trees?

Iowa.

Carl Stuebe.

It is unwise and unprofitable to plant either fruit trees or small fruit vines in a land which is continually wet and not properly drained. Even for vegetables such land is not suitable. I advise you to plant grapes and other fruit on this rolly, hilly land to which you refer. Asparagus will do better on this land than any other vegetables. This land is especially adapted to grapes. I would advise you to plant Concord and Warden in a commercial vineyard.

Any of the American or Mediterranean breeds of poultry would give you profitable returns. Fowls of the Mediterranean class will do as well on heavy soil as will American breeds. I would build the poultry houses on the high ground, reserving the lower ground for the production of grass.

The Red Cedar tree is a menace to apple trees. The Red Cedar rust is very detrimental to an apple orchard and so far no spraying material has been found that will combat it.

WHY Basic Feeds Customers Dominated In the Shows And Egg Markets

Here Are the THREE Reasons Why

Buttermilk Starting Mash

One of the finest starting mashes ever placed on the market for young chicks. We recommend it purely as a starting mash to be fed after the chicks have been out of the incubator a day or two and have first had grit, charcoal and water. Feed it dry. Feeding Basic Feeds Chick Mash to your young chicks is one of the surest preventives of bowel trouble. When fed according to directions it will give your chicks a fine start and eliminate largely the losses and heavy mortality so common among young chicks when improperly fed. It is composed of Wheat Bran, Wheat Middlings, Rice, White or Yellow Corn, Rolled Oats, Hulled Barley and Dried Buttermilk.

Basic Chick Grains

An especially compounded feed that we have found by extensive experimental tests is best adapted for giving your chicks a fine start. It is a rapid frame, muscle, sinew and feather builder, composed of cracked No. 1 hard wheat, pinhead oatmeal, cracked rice, cracked hulled barley, and cracked corn, correctly proportioned, milled and blended to contribute to a rapid and healthy growth of your young chicks.

Basic Feeds Growing Mash

contains all the required food elements to quickly grow and develop young stock. It develops long, wide frames, well muscled, strongly sinewed and well feathered bodies. Young birds thrive on this mash and make rapid and healthy gains. We don't believe any other feed has ever been prepared that will equal BASIC FEEDS GROWING MASH. It is composed of Wheat, Bran, Wheat Middlings, Rolled Oats, Rice, Corn, Hulled Barley, Bone Meal, Beef Scraps, and Dried Buttermilk, all thoroughly mixed, finely ground and blended to best produce the results we claim for it. We recommend this mash for chicks 6 weeks and older.

The outstanding regularity with which Basic Feed customers were awarded winnings at various poultry shows throughout the country the past season and the wonderful records of egg production by Basic Feed customers everywhere, proves that there is some good sound reason for their marked successes.

There is a reason—in fact, THREE reasons, namely, BASIC FEEDS BUTTERMILK STARTING MASH, BASIC CHICK GRAINS and BASIC FEEDS BUTTERMILK GROWING MASH—a combination that makes a complete ration for raising and developing growing stock.

Our customers feeding this Basic Chick Ration, brought their birds to the show rooms and laying pens with fully grown, well feathered bodies, filled with health and stamina while others failed who depended on those feeds which require as a supplement the gifts of a bounteous nature such as bugs, grasses, etc., to give the feeds the growing qualities.

When nature provided as she did in 1921—a dry season, with a scarcity of tender bugs and grasses, feeds that depended on nature to supplement these things failed, and growing chicks fed such a ration were as a result backward and underdeveloped.

Why take chances—why depend on nature supplementing your ration when you can get a COMPLETE ration—one that fully supplies every requirement of the growing chick—one that produces healthy, rapid growth and brings them to early maturity? Such a ration you will find in the three feeds described at the left of this advertisement.

Write today for free samples of these record producing feeds—also our money saving price list—learn how you can buy these quality feeds direct from our mill at a substantial saving—not only in first cost, but also in quantity used because Basic Feeds, being made of the choicest ingredients the market affords, go much farther than ordinary feeds. Don't delay—write today.

Basic Feeds Company
Department 325 Lockport, Illinois

Even more

Profit

The price of feeds has tumbled—egg prices are still high—and the profit in chickens is greater than for many years!

If ever there was a time when the keeping of poultry was profitable—it is NOW.

But just as important as ever before is the intelligent choice of a breed.

SHEPPARD'S "Famous" ANCONAS

have demonstrated their ability to produce profits even when feed prices were sky-high. Now, when almost any fowl can turn out SOME profits, the "Famous" Ancona is far in the lead with GREATER profits. Leading the world in egg production, both for individual and flock records, Anconas are easily the most profitable breed in the country.

For 14 years Sheppard's Famous Anconas have won the great majority of prizes offered at the world's premier shows. Their clean-cut, lithe lines, their erect, graceful carriage, their snappy black and white plumage, makes them prime favorites.

Read about the pleasure
in thoroughbred "Famous"

Box 506

BEREA

OHIO

This Season's Chicks Makes Next Year's Profits

(Continued from page 466)

chicks in a field where only five hundred should have been, but the more serious fault was found when he investigated why a great group of half grown Leghorn pullets were congregated over in a corner. They were trying to eat the water trough, in fact. It hadn't a drop of water in it, nor had it had for several hours as the cracks were large in the bottom. I pointed to it, and said why did you send for me. Do you get the point? Water is one of the first requirements of growth. It expands cells and tissues, aids digestion, softens food particles, controls body temperature, and does many other services that render its use indispensable for growing chicks. Lets remember that. Provide it in abundance, and always fresh and clean. The chicks all go to the water trough. So do not allow it to become a source of the spread of contagion.

VITAMINES, TOO.

Chicks are growing animals, and they're growing fast, or should be through this whole summer of 1922. They need regular food in abundance, but they need vitamins, elements that are found in milk and green foods. Therefore, to make a long story shorter, furnish the growing chicks with green plant food every day this summer, and with milk also, whatever amount they want. The soured forms of milk appear to be more quickly digested and used to better advantage.

FEED THE CHICKS FOR GROWTH

Fill up the mash hoppers that are large enough and attractive enough to almost force the developing chicks to continually use them during the summer. There are many good growing mashers. The writer has used three parts of wheat bran, one part each of wheat middlings, ground oats, or ground barley, cornmeal, and meat scrap, adding five percent of fine ground dry bone meal, and five percent of dried buttermilk or dried skim-milk, if these latter are available at reasonable prices. Supplement this mash with a grain ration of wheat and oats with a little cracked corn as summer advances.

Brooding and Feeding the Baby Chicks

(Continued from page 469)

gizzard to help grind the feed that is to be eaten.

The first feed for the baby chicks should be something that is easy to digest and the amount given should be limited so there will be no danger of overeating until the body becomes accustomed to the disposition of food materials. Rolled oats crumbled fine and fed dry and uncooked is an excellent ration for the first few feeds. By dropping the oats slowly onto a piece of board or paper the attention of the chicks can be attracted and they will begin to pick at the fine particles. In the first feeding an effort should be made to get each chick to eat and if any feed is left at the end of ten minutes it should be removed so that no chick will get too much. Feeding periods from the second to the fifth day of the brooding period should be not more than three hours apart and the aim should be to feed little and often. After the chicks learn what feed is for they can be induced to take exercise by feeding a little of the feed in the litter so that they have a chance to scratch it out.

After about the fifth day of the feeding period the rolled oats can be gradually replaced by commercial chick scratch feed or by finely cracked corn.

When the chicks are about ten days of age the danger of overfeeding begins to disappear and they should then have access to a dry mash fed in low troughs or self-feeders where they can eat any time they feel like it. A satisfactory mash for the growing chicks can be made by mixing 100 pounds of bran, 100 pounds of shorts, and 50 pounds of commercial meat scraps or tankage, or by using 100 pounds of bran, 100 pounds of shorts, 100 pounds corn meal and 100 pounds of meat scrap or tankage. Where the chicks are getting all the milk they can drink each day the amount of meat scrap or tankage in the mash can be reduced to ten per cent of the total weight of the mash.

During the brooding period fine charcoal and granulated bone should be kept before the chicks in self-feeding hoppers. The charcoal helps to control gasses in the digestive tract while the bone furnishes phosphorus needed for bone building.

Chicks will consume relatively large amounts of tender green stuff if given access to it,

Just as much

Enjoyment

Are You Missing Something?

Are you experiencing the downright joy of working with thoroughbred stock, the pleasure of "puttering" around a hen house in your spare moments, of collecting, and eating the fine fresh eggs, of petting the sleek, smooth, beautifully-marked bodies?

If you are—

SHEPPARD'S "Famous" ANCONAS

will win their way to your heart, and prove a source of genuine pleasure.

They are so alert, so "alive." A little kindness, and they will be tame as kittens. Their lustrous, mottled plumage makes them a delight to the eye. The "Famous" hardness renders them immune from many diseases that frequently make the care of other fowls disagreeable.

If you would be really proud of your flock, and enjoy them wholeheartedly—try Sheppard's Famous Anconas. As for profits, read the "ad" across the page.

The "Famous" Catalog
tells the entire story.

and it is worth while going to some trouble to supply fresh pieces of sod, sprouted oats, or leafy materials such as lettuce or onion tops.

The real baby stage in the life of the chick is soon over and it is well worth the efforts required to pet them along by visiting the brooder house every few hours and giving the chicks the best of attention to see that they have the right temperature in the brooding quarters, that they always have something to drink, and that they are given the kinds of feed they need in frequent, small feedings.

A New Poultry Book.

(Reprinted from the Breeders' Gazette.)

For a long time breeders of the American breeds of fowls have felt the need of a history of these breeds, which occupy a prominent place in the poultry industry of this country; but until now no one has felt like undertaking the task. American breeders of every sort of live stock have shown ability to take what foreigners have begun and improve on their work, but in no line of breeding have we made greater progress than in the breeding of poultry. Along this line several distinctive and valuable types have been perfected. These are known as the American breeds, because they have been made by the skillful blending of several foreign breeds, and have proved themselves to be better than the breeds to which their bloodlines trace. The six varieties of Plymouth Rocks, eight varieties of Wyandottes, two varieties of Rhode Island Reds, two varieties of Javas, the Buckeyes and the Dominiques have all originated in America, and are distinctively American breeds. Besides these there are several other breeds which have not met with great popular favor as yet. Among these are the Rhode Island Whites, the Blue Plymouth Rocks, the Black Giants, the Fluffs and perhaps others. These minor breeds are yet on trial, but some of them promise to take a high place when they become better known. Frank L. Platt, a practical poultryman and a competent judge, has written and The American Poultry Journal has published, under the title of *The American Breeds of Poultry*, a book of 256 pages, a most complete and interesting history of the American breeds. The first hundred pages are devoted to a general history of poultry. This section shows diligent search through all the available records in which are set down the history of domestic fowls. There is a discussion of breed types, the principles of breeding, the instructions how to select layers. Then follows a history of the several breeds and their varieties. The first part of the book is valuable for breeders of all varieties, while the history of the breeds is like a visit "back home" to one who, like the writer, has been privileged to visit many a time and oft the men who were interested in the making of these breeds. The names of Felch, Williams, Buffinton, Aldrich and many other veterans of the poultry industry in America appear, and the stories that they set down in this book. It is safe to predict that this volume will become a classic among poultrymen. Its permanent place in the poultry literature of the country is assured. Many things that have never before appeared in print have been collected and presented in the text in a most interesting way by Mr. Platt. The book is well bound in cloth.—Miller Purvis.

When Eggs Bring the MOST Money

—that's the time you want to be sure to get them.

It's perfectly natural for most any hen to lay in the warm sunny months when all conditions are favorable. And this increase in egg production is reflected in the lower prices. But to keep it up when real, hard winter weather sets in—and the price mounts to a juicy profit figure—your birds must be of a strain with the LAY bred in.

Build your flock with your eye on that October-February period. This advice is more than worth listening to—it's worth doing NOW!

Go in for winter Eggs—the profit eggs. Have laying hens while your neighbors have only eating hens. Winter laying is a quality bred in.

"Laid 1011 eggs in four consecutive years—laid 25-27-29 eggs in the three coldest winter months in ninety-eight years by Official Records"

Lady Victory

Our Consistent Contest-Winning Strains

S. C. W. Leghorns—White Wyandottes—S. C. R. I. Reds

—a statement backed by their showing and consistent leadership in Official Egg Laying Contests since 1912. In illustration above, Lady Victory gives the profit facts. Next year our 306-Egg Keystone Maid, Champion all breeds, American Contest, laid 28 eggs in 28 days of February. Liberty Belle, our 294-Egg Wyandotte, laid 21-21-23-23 eggs in December, January, February and March. Our Champion 1301-Egg White Leghorn Pen in American Contest, laid a total of 129 out of possible 140 eggs in February. In 1919-20 our Wyandotte pen led all pens in American Contest in egg production for five coldest winter months, excepting only our pen of Leghorns, the five birds in this latter pen making the phenomenal record of 137 eggs out of possible 145 in the 29-day month of February, 1920.

AGAIN WE LEAD Of the pens entered from abroad the Pennsylvania Poultry Farm pen of White Leghorns takes first place," is the latest official report from The Daily Mail International Contest, at Suffolk, England.

Here and in England In the current Texas National Egg Laying Contest a Leghorn Pullet of ours leads all entries, all breeds for winter egg production.

World's Foremost Poultry Feeding Secrets

Most Remarkable Book on Feeds and Feeding Ever Published

If you want to learn about the most successful feeding methods for poultry of all ages, ascertained after years of experimentation on the part of our best breeders and poultry experts; the best feeding formulas used by the leading agricultural colleges in America; a formula for a standard egg producer that will turn any kind of hens, old, young, mongrels or purebreds, into veritable egg machines; and a great mass of other valuable information on feeds and feeding—then you must have a copy of our latest book on poultry feeding, "World's Foremost Poultry Feeding Secrets."

The one chapter giving a recipe for the Standard Egg Producer is alone worth the cost of the book.

50 Scrub Culls Produce 35 Eggs Per Day

To ascertain the effectiveness of the Standard Egg Producer of the Standard Poultry Company of San Antonio, Texas, purchased fifty very low class mongrels, ages 2 to 4 years. The hens looked as though egg production were an impossibility with them. "When we began feeding the Standard Egg Producer," reports the Standard Poultry Co., "they were not laying—not even one egg a day. In eighteen days after feeding them the Egg Producer they began laying, and at the end of six weeks, their daily average was 35 eggs. They held this high average until we sold them, several months later. We have tested the egg producer with purebreds and with mongrels and in every case it produced an astonishing increase in egg production."

Standard Egg Producer Makes Any Class of Hens Lay in Any Season

The Standard Egg Producer is a respecter of no class of hens or seasons of the year. It will make scrubs lay in the winter just the same as purebreds in the spring. If used in connection with artificial lighting, the high egg yield would almost stagger the most skeptical.

The formula for Standard Egg Producer is invaluable to any person who keeps hens for profit, yet it takes up only one small chapter in our wonderful new book on poultry feeding. Some other subjects treated are:

Kinds of food necessary and their respective value—water, green feed, animal feeds, wet mash, dry mash, scratch grains, grit, oyster shell, milk, oats.

How to obtain a balanced ration.

How often and how much to feed.

Housing poultry in various climates.

Which is the best breed.

Feed as important as breed.

Poultry diseases.

Profitable age of hens.

How to select the non-layers.

Artificial lighting to increase egg production.

Commercial ready mixed feeds.

How to market eggs.

Why many poultry farms fail.

Preserving eggs.

Best methods of fattening poultry.

Foremost egg producing rations. 57 formulas

of scratch feed, dry mash, wet mash, etc., that have been found most successful by leading agricultural colleges.

Feeding chicks.

Best methods and formulas of home made feeds for chicks at various ages—the first

feed, starting foods, growing mash, feeding the first week, feeding the second week.

How to feed turkeys.

How to feed ducks and geese.

Monthly Prize Article Contest

American Poultry Journal pays \$4 and \$3, respectively, for the two best articles sent in each month on poultry subjects. Choice of subject is not limited. The articles need not be lengthy. Helpful suggestions based on the writer's experience afford the basis for awarding the monthly prizes. Photos or drawings for illustrations will be welcome when available. Articles may be mailed any time during the month. Write your name and address at top of first page and the words "A. P. J. Monthly Contest." Write article on only one side of the paper.

Worms and Mites FIRST PRIZE ARTICLE.

In every poultry center, from the suburbanite to the ranch of pure egg-makers, there are a certain per cent of flocks that "don't do well." Look at the roosts and droppings, not the feed-bin.

In the first place, these birds that cause the owner to ask everyone why they don't start to lay, and to buy a barrel of health-breaker called strike-breaker, when he knows they eat ravenously, of good food, and the other bunch that are developing several stages of colds, are really being weakened, every day, by one of two causes, neither one of which he might think of blaming. These are: Some one or more of the five popular varieties of lice, or—worms.

Lice and worms are the real trouble, generally, though the innocent chicks may be treated for any one of a dozen different "ailments." It is admitted that worms exist in a few birds in nearly all flocks unless treated with the right, efficient remedy. The only question is whether or not they exist to a detrimental extent. Birds with worms seem always hungry, yet they are light in weight, and soon become little but feathers and bones. Their comb and face lose color, and their strength and energy are gone. Lifeless, they become too weak, in time, to even eat. In some cases the intestines become distended with balls of worms, and sometimes they perforate the walls, causing death. A serious danger.

There are some 36 varieties of worms, whose sole aim is to take all the food they can. Much of that food which they miss will not be digested because the worms have ruptured so many of the delicate cells lining the intestines, which secrete juices to help digest the food, and consequently much of the food is wasted. The most common, the round or wire worm having both ends pointed or horned, are found mostly in the upper or small intestines, where most of the digestion takes place in poultry. They are soft, and would be digested readily, if killed there. The fact is these undeveloped chicks are under-nourished, robbed of their food day and night, and their vitality is bound to suffer.

The worms consume their food in the large and small intestines, from the upper, smaller intestines, to the lower bowels. They seldom reach the gizzard. The red mites suck the blood from the skin at night, when the fowls are on the roost looking for rest, not a fight. Normally, when hungry, the red mite is pale grey; it's the chick's blood that turns him red.

There is nothing save lack of water stops laying quicker than red mites. It only takes a week for their eggs to hatch and grow into a mature breeder, laying more eggs. If not interfered with, one pair will lay thousands of eggs in the summer months. The heat from excess droppings helps vastly in hatching their eggs.

Ordinary coal oil, or whitewash as ordinarily made, will not kill the tiny eggs, before they develop out of the egg stage. For this reason their value is only temporary; other oils will penetrate the wood, saturate it, and stay on the job for several months. Many people whitewash once a year, and think it is sufficient. It is about the poorest and costliest paint there is, as generally made, as it soon scales up and drops off, forming ideal breeding quarters for thousands of red mites.

The cheapest and quickest way to get rid of red mites is to burn up all roosts infested, and replace with roosts of new, planed, clear lumber. Suspend these from the roof by

wire, instead of support from the wall, and paint with a commercial preparation made especially for the purpose, or soak in hot grease, old transmission grease, dissolved, is good.

Roosts so treated had no mites at the end of a year's use on my place. Lice do not like metal roost supports, and tallow or grease fills all cracks in the wood, as well as the pores in the body of the louse, through which they breathe.

Roosts made of rough, unpainted lumber are a crime. There are 31 species of insects that infest poultry.

For intestinal or round worms there are a multitude of remedies, some cheap and others expensive. Ground tobacco has been used for years, but more effective and surer means are now being used by the "Progressives."

Government laying contests, such as those at Puyallup, Wash., and at Santa Cruz, use tobacco. The records of the last Puyallup contest show that tobacco did not "get," or kill, the worms, as four hens actually died during the contest, of worms, and trouble exists in the present contest. Yet the millers claim tobacco kills worms.

While one hen dies, a great many more are suffering, and needing treatment. The Farm Bureau laying contest at Petaluma, run by poultrymen not confined by red tape, does not use tobacco, nor do many of the producers in Sonoma county. Many believe the hen's system becomes so used to a steady use of tobacco, that it loses its kick similar to humans. (The first drink or smoke is the strongest!)

The tobacco paralyzes the worms, and they lose their hold (they have hooks at head and tail); they are then expelled in the droppings (full of eggs) to be scratched for and eaten the next day by other hens, thus spreading instead of blocking the progress of the parasite. When the weather is cloudy or cold, a large per cent of the hens stay in the house. The droppings in several large poultry centers are cleaned one to three times a week, so the hens have plenty of opportunity in which to recover most of the "expelled" worms, as so few of the droppings boards are wired over. Corliss saved many a dollar in eggs alone, by doing this, not to mention having cleaner eggs, fewer egg-eaters, and help in fighting worms. A good many, in every flock, spend at least an hour a day scratching on the droppings boards. Many are able to clean the first thing every day; they are fortunate.

Some Other Remedies.

Some of the other remedies for worms are: One teaspoonful of olive oil and turpentine; one teaspoonful of powdered pomegranate root bark for every 50 fowls; 2 grains Areca nut per fowl; one-grain doses of thymol, ground pumpkin seed, garlic, even coal oil and many other impractical things too numerous, costly and dangerous to fertility to give.

Onions are being used as a poultry food more and more, and should be fed once a month or oftener, if price and location will permit. Large amounts of onions, potatoes, and apples are wasted every year, that chickens could use, and be healthier for having them.

As a result of a great deal of valuable experimentation, the work goes to show that the loose surface ground and filth can become polluted to a possible depth of two inches with the eggs, which are expelled in large numbers regularly. These eggs grow or develop for three weeks, after which, if eaten, the bird will become infested with worms. They found the best way was to thoroughly scrape and clean the yard down to fresh earth, and then treat the birds. Without treating the yards vigorously, tobacco was useless. It is plain, therefore, that where worm infestation becomes a problem the practical thing to do is to grow the chicks on entirely fresh ground. By cropping the infected soil for two years nature cleans it up.

Everything seems to show the bone of contention is the lack of cleanliness, in one or more of its branches. In some localities the majority of the hens are confined to a small coop, in a series, all their lives, on a sand floor; in another, the hens (fewer every year) have several acres of bare, hard hill side, without excess house capacity or greens; in another the poultry manure is used in the runs as fertilizer, and the chickens scratch and eat in their own filth. FAIRFIELD HATCHERY
Lock Box 504, Lancaster, Ohio.

stands for progress, and which a trip through the country in any direction will clearly show is by far the most popular way, the hens are confined to alternately seeded yards, with a generous sized house having plenty of light from all sides, and plenty of scratching space for dry straw. The birds are always busy; they might just as well be allowed to use their good habits as their vices. Therefore, clean, roomy, green seeded yards; clean, sanitary, sun lighted houses; strong stock and proper care are the preventives of most of our troubles.

Colds have many causes; disinfecting the water should be the first move. It will be found that worms and colds are partners—worms by reducing the natural resistance to disease.

It is the same with poultry as with humans. Everyone in a certain crowd is not equally susceptible to a cold, if exposed to a draft, but illness and poor health are bound to result from lack, steadily, of sufficient nourishing food and cleanliness.

If one's pullets have intestinal forms and head lice, and have to use roosts that harbor thousands of red mites, in every crack and hole and joint, they cannot and will not grow and lay per expectations. Give them a fair and decent chance. A last word: You certainly can over-do in the feeding of grit to baby chicks. Some dealers suggest grit the first day alone. Why does a tender chick's body need grit? It's a costly mistake. You should not expect baby chicks to know as much as we do. A. W. Menefee.

Colorado.

In the Spring.

SECOND PRIZE ARTICLE.

Give the roosts a dose of kerosene, or some lice paint to kill the mites. You may not think that there are any mites on the roosts, but in a month or two if you will look carefully in the cracks and joints you will likely find them. It is a simple matter now to get rid of those on the roosts and have a clean house this summer; and yet we find many hen houses where the same roosting poles are left in place for years without treatment.

If there are body lice, now is the time to get rid of them, for with the warm weather they will begin to multiply. A good dust bath will help, but it may be that you will want to use some lice powder on the hens. Get any of the prepared powders. Cut the top off the can and apply to each bird by the pinch method. Do this at night after they have gone to roost.

Provide plenty of oyster shells now, for this is the time when the hens, in full lay, may be most disposed to lay soft shelled eggs, and a few of these, should they become broken, may start the flock to eating eggs.

See that there are plenty of nests and that these are in the dark parts of the house and so placed that the light does not shine into them, or you may hang a bag or carpet over them to shade them. Crowding in the nests may cause broken eggs and this may start egg eating. One nest to about four hens is the right ratio.

In case they do begin to eat eggs, put some vinegar in the drinking water, and tear up some brown paper and put in the water also. The habit may be a whim, not difficult to overcome. If some one or two hens persist in eating eggs, shut them up or eat them.

In setting hens, use straw in their nests. Set them away from the laying hens.

I find that sawdust makes a good nest material for layers; they will not dig it out, and it is clean. Some prefer excelsior for laying nests. It is too dry for setting nests.

New York.

Mrs. F. S. Upton.

Poultry in Wisconsin.

Wisconsin is steadily forging ahead as a poultry state. The last census shows that we have gone ahead of both Michigan and New York in the number of poultry upon our farms. The census credits us with between 11,000,000 and 12,000,000 chickens upon our farms. We anticipate that the importance of the poultry industry will be appreciated more and more in the future and we feel certain that we can count upon you for your co-operation in promoting it.

The Cause of White Diarrhea

White Diarrhea is caused by the bacillus Bacterium Pollorum transmitted through the yolk. There is scarcely a hatch without some infected chicks. The germs multiply very rapidly and one infected chick may infect the entire brood. The germs can be killed by the use of preventives. Intestinal Antiseptics to kill the germs should be given as soon as the chicks are out of the shell. It is much easier to prevent than it is to cure.

How to Prevent White Diarrhea

Dear Sir: I have raised poultry for years and have lost my share of little chicks from White Diarrhea. Finally I learned of Walker's Walko Remedy for this disease, so sent for two 50c packages to the Walker Remedy Co., Dept. 646, Waterloo, Ia. I raised over 500 chicks and never lost a single one from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor—they develop quicker and feather earlier. I have found this company thoroughly reliable and always get the remedy by return mail. Mrs. L. L. Tam, Burnetts Creek, Ind.

Don't Wait

Don't wait until White Diarrhea gets half or two-thirds your chicks. Don't let it get started. Be prepared. Write today. Let us prove to you that Walko will prevent White Diarrhea. Send 50c for box on our guarantee—money back if not satisfied. Walker Remedy Co., Dept. 646, Waterloo, Ia.

More Uniform Judging.

Much has been said and written about more uniformity of judging poultry and we all realize that it would be a good thing if more uniformity of placings could be brought about. As a matter of fact, the American Standard of Perfection is the guide by which all judges work and by which all breeders select their birds. Why then should there be such a difference if we all strive to follow the rules and descriptions as they apply to the breeds and varieties?

There is no question but that all judges try to judge a class in the show as nearly right as they know how; or, in other words they judge as closely as possible to their interpretation of the Standard. It is true, also, that they have different ideas and opinions, some laying more stress upon one section than another. Some may be influenced by type over color and vice versa.

Very often two birds will be shown at one show one week under a certain judge and the following week the same birds are judged by another judge and the awards will be reversed. That is, the bird that won first under one judge is given second under another judge one week later. This is not always the fault of the judges because in a week's time a bird may change very materially. Perhaps the best bird at the first show may have become out of condition or the plumage may have become soiled or ruffled or some of the tail or wing feathers may have become broken, while the other bird is in even better condition than it was the week before. Under those conditions it is perfectly natural that the awards would be reversed. Then, too, these two judges may slightly differ in what they believe to be the best bird of the two. We do not all see things alike and we may perhaps differ upon the exact interpretation of the Standard description, especially in color. For instance, the Standard in describing buff color uses the words "golden buff." Gold is of different shades of color, some gold being darker than other gold. One judge may prefer a light golden buff, while another has an idea that a darker color is what the Standard calls for. And so it goes not only in color but in other sections as well.

There is not only a difference among poultry judges in their opinions, but judges who interpret the statutes as well. A case may be tried in a court of justice and is decided in favor of the plaintiff. The defendant takes an appeal to the district or circuit court and there the judge reverses the opinion of the justice of the peace and renders a decision in favor of the defendant. Not being satisfied an appeal may again be taken to the supreme court and there the opinion of the district judge is reversed and the decision of the justice of the peace is upheld. It cannot be said that the judge of the district court did not know the law or that he was unfair in his decision, but he decided the case as he saw it and according to his interpretation of the law. All judges make errors and they always will as long as the world stands. The old saying that the man who never made a mistake never did anything, holds good in all lines of work.

DR. LE GEAR'S POULTRY PRESCRIPTION

Poultry Plant and Hatchery For Sale

This plant consists of a general farm of 302 acres of which about 150 acres is in timber land and the balance cleared. About 250 bearing apple trees and several pears. Modern two-story semi-bungalow of 7 rooms and bath. Good barn and grainery. Tenant house. Spring fed creek suitable for ram or water wheel.

Poultry plant consists of about 1,000 S. C. W. Leghorn layers. Genuine trap nested high producing stuff. 245 trap nests with records, etc. About 1,000 growing pullets. Two large modern heneries of 500 capacity each. Two brooder houses with capacity for 2,400 chicks, or more. Incubator cellar with modern Newtown incubator of 5,400 capacity. Makes a specialty of hatching eggs and baby chicks.

This plant would appeal especially to a man desiring to do general farming in connection with his poultry operations, however, present owner does not do any farming. Plant located within 100 miles of Washington, D. C., on the main line of R. R., and within 1½ miles of county seat with good school and churches. Quick service to Washington and New York City. Plant is in full and successful operation and experienced man could take immediate charge. To a beginner, will state that present owner would stay several months, if desirable, and thoroughly instruct purchaser in every phase of the business. Positively only reason for sale is ill health of the owner who desires to make a complete change. Price \$21,000. If you have the money and mean business, write for full particulars. Expect to make a quick sale and would advise you to act promptly as this is a chance for some one, especially a beginner. This is not a close-out sale and will bear fullest investigation as to reliability and success. Write J. H., care American Poultry Journal, Chicago, Ill.

Columbian Plymouth Rocks

"That do lay and are fit to show." Our win at "The Garden" this year: 1st Pullet, 1st and 4th Young Pen, and 3rd Old Pen; have also added to our string the 1st Cock, who will head one of our best pens of females. Duffield Farm Columbians have high average flock production. Our Columbians will average under ordinary conditions from 13 to 17 dozen eggs each in one year. Let us help put the lay and show qualities in your flock. Eggs, \$5.00 and \$10.00 per sitting. Mating list on request.

Preserve Eggs Now Get High Winter Prices

Turn Cheap Summer Eggs Into Winter Profits

Don't sell or eat all your eggs now. Preserve all you can spare; use or sell them next winter and get high prices. Last winter eggs were the farmer's and poultryman's only salvation. Why sell your eggs now at present low prices? Next winter they will be worth three times as much to you. Fresh eggs laid down in K. & G. Egg Preservative will be just like new-laid eggs.

K & G Egg Preservative Keeps Eggs 100% Perfect

K. & G. Egg Preservative is guaranteed to preserve all fresh eggs perfectly for one year. No change whatever takes place. No odor. No taste. Eggs can be used for all purposes. The yolks do not break down. Fresh, new-laid eggs remain fresh a whole year.

K. & G. Egg Preservative is not liquid glass or any other stinky mixture. It comes in powder form and makes a clear solution, clean, cool, and pleasant to put eggs in or take out. No foul odor, strong or stale taste is imparted to eggs. Cleanest, most perfect egg preservative in the world.

Read These Testimonials From Satisfied Users

"We used K. & G. Egg Preservative with very satisfying results. We consider it superior to water glass. Eggs preserved are in very fair condition at this time." (Jan. 1, 1922.) J. L. Miller, Comm. Dept. Food & Drugs, State of Indiana, Indianapolis, Ind.

"Can safely say K. & G. is all you claim for it, and then some. I packed 12 dozen in April, 1921, and they sure looked swell." Ben Swanson, Colona, Ill.

"Your K. & G. Egg Preservative is very successful. Had eggs down eight months. Found them all O. K. Will use nothing else." W. H. Woodell, Winchester, Ill.

"I invited all my neighbors to see the wonderful results obtained with K. & G. Bought eggs at 15c; put down 50 dozen. Began using when eggs went to 30c. Your K. & G. is wonderful. Don't see how farmers can be without it." John Bitzer, Waco, Texas.

Double Value of Present Egg Supply

Write for more testimonials just like these and free circular on Egg Preservation. Learn how to double value of your present egg supply. Preserve them now in K. & G. Egg Preservative. Next fall and winter when eggs are high, your preserved eggs will be just like new laid eggs. Big package, enough to preserve 25 dozen, 50c postpaid. Send your order today.

Coming back to the question of more uniform poultry judging I will say that I am a firm believer that the comparison system gives better results in this respect than does the score card. If birds are judged by comparison and they are actually compared in the full sense of the word, then we can arrive at a better result in placing awards. In large classes it is impossible to carry all the defects of type and color in one's mind but it is necessary to first eliminate all specimens that are not in the winning, and that can be done by giving them the once over. When we get down to six or eight birds, all of which are good, then they must be compared section by section, the defects of each carefully discounted until a final decision is reached as to which bird has the least defects and is entitled to the blue ribbon.

This cannot be done hurriedly where the competition is keen because every specimen must be given due consideration. The system used in many shows is to provide a few coops where the birds may be lined up in a row. This way they are all examined under the same condition and the same light. It is not fair to examine one bird under an electric light and the next one at a window in natural light. They should all be given the same advantage. In many shows the writer has been obliged to carry birds fifty feet, and even farther to a window in order to get them in a light place, and when once a class is started this way every bird is carried to the same window. Sometimes it is necessary to carry them several times before a satisfactory decision can be reached.

When possible it is a good plan to have three or four persons assist in carrying the birds to the light so the judge may have an opportunity of seeing them all at the same time under the same conditions. Perhaps those who advocate the score card system never stopped to realize how much more time a judge puts in on a class under the comparison system than he does under the score card system. When using the latter system he handles each bird just once and then only a few minutes. After the bird is placed back in the coop it is never brought into contact with any of its competitors and the judge is supposed to carry all shades of fowls and everything else in his mind.

When birds are properly compared they are handled and rehandled, compared and recombined until the awards are all placed. There is therefore every reason to believe that when a judge gets through with his comparisons that the best bird has won.

The poultry judge must also be fearless and impartial in placing the awards. He must not be timid about leaving out one of the big breeders if the little fellow has better birds. He must judge the birds regardless of their owners and unless he can do that he has no right to don the duster. As long as he is fair and honest, judges to the best of his ability and has a reason for all the awards that he makes, his services will be in demand. On the other hand if he is weak-kneed and tries to please certain exhibitors by being partial, then he is short lived as a poultry judge. E. H. Hoffman.

Costs Only \$4.96, Complete

In an hour you can make a better brooder than you can buy. No tools needed but saw and hammer. It will do the work of 4 old hens and do it better. The materials, including heater, cost \$4.96.

I want you to try my Brooder and will send you plans for making it, together with a Putnam Brooder Heater, for \$4.75; all postpaid. Try the Brooder out and if you don't say it's the best Brooder you ever used, return the Heater in 30 days and get your money back. Your dealer will make you the same offer and guarantee. Ask him, but if he does not carry the Brooder Heater, send me \$4.75 and I will mail you a Brooder Heater and plans promptly. Illustrated circular free.

Poultry In California

As I look around at the husky Red pullets and large red combed Leghorns that are filling our egg baskets, my thoughts go back to the time we were preparing to leave our home in Illinois to live in the Golden West. Friends advised me that my "chicken raising" days were over as it could not be done in California; the fleas would surely get them. It made me feel blue with such a prospect for I did love my White Rocks, but I was very sure I would find some way out.

After the worry and excitement of moving a family of five children had subsided and we were finally settled on two acres we were to call home, my mind drifted to chicks again.

From reading California poultry literature I understood it was R. I. Reds and Leghorns that were in demand so those two breeds would be my choice.

Eggs were bought in February from healthy flocks that were laying well, and put into a second hand incubator of reliable make. As they hatched well, neighbors brought their eggs to be incubated, so by working for others, by dressing and selling my surplus cockerels to private customers, I paid all my own expenses and had a fine lot of early hatched pullets laying when eggs were at the best price. The Reds were splendid winter layers, but eggs were not coming from my Leghorns as they should so I just camped with them for three days and slipped a band on all hens who visited the nest. Soon it was only banded ones who were coming back, then I knew the ones doing the laying were marked. In January a male from trap nested layers was mated to these banded hens. We hatched a few in January and more in February and such layers as they produced we never have had.

We have the one hundred in an open front house 12x28 with good sized yard at back and sides. Roosts and dropping boards are along the back three feet from the floor. Doors that are hinged at the back under the dropping boards, are kept open in warm weather but are shut tight when cold, as we try to have the back and sides almost air tight, so there are no drafts.

The have a commercial egg food, charcoal, oyster shell and grit before them at all times with scratch feeds at morning and night. Green feed, such as alfalfa, chard kale, beet tops, barley and rape is ground fresh every morning and fed in long troughs running along the front of the house. Can you imagine a more pleasing sight to the poultry man than the long row of red crowned heads against the green and happy biddies singing as they grab a mouthful here and there? Such a busy, hustling bunch.

Water is piped to each pen and all pens are cleaned in the evening so when they go for their drink first thing in the morning it is perfectly fresh and clean. During the coldest months we fill the pans with slightly warmed water before the hens are off the roosts, as icy water does not help egg production, and we do have icy water in California, even in our "frost-less belt" at times.

Our Reds have large yards in the peach orchard with open front houses. Fifty pullets hatched in January are

A truly business bird backed by 15 years of experienced breeding for heavy all the year round persistent laying; and trapped 365 days in the year. Our birds lay a large brown and large white egg. We guarantee we sell no culls or slackers. Eggs and chicks are from our own breeding pens. Our aim is a satisfied customer. We solicit the honest patronage of all who want a satisfactory bird at a satisfactory price. Write for our price list.

DR. B. H. MANSEL, Box 202, QUAKERTOWN, PENNA.

laying from thirty to thirty-seven eggs a day, while they are at the highest price. Houses are sprayed often with crude oil, and crude carbolic acid, as the lice must not be forgotten.

My incubators started in December and I have had all the work I could do with my four incubators. I have added a machine each year but as my husband has other business to attend to in town, I think I will have to stop with my 1000 egg capacity and 250 layers.

Fifty October hatched chickens are scratching out in the alfalfa and under the berry bushes with no danger of snow or hard frozen ground preventing their bug hunting. Soon the rains will patter down and the green grass will grow, then who can say chickens can not be raised in California? I think it a "poultry woman's" paradise and if my biddies could talk would sing with me, "I Love You California."

California. Mrs. George Hayden.

Right Methods Brought Success.

My interest in poultry was first aroused when, several years ago, I was told by my father that it would be my duty each day to look after the chickens. At that time he had just completed what he thought an ideal chicken house. As I look back and recall the time, effort and expense that were put on that house, I say: What serious mistakes will be made in building poultry houses when one has not the first idea of what the hens require in the way of adequate accommodations.

I was supposed to look after the hens. No thought was put forth as to what kind of feed they should have. I did not know the first thing about the care of poultry. Had never read anything on the subject, and had never heard the matter discussed by any practical poultryman. But, I certainly did look after those hens. I fed them every kind of feed I could find on the place, the biggest part of it being entirely unsuited for chicken feed. Being naturally very ambitious I said to myself, as I was going among the flock one day: What is the sense of me bothering with these hens? I may as well employ myself more profitably. It is just a waste of time, feed and money in keeping these hens. The housing conditions can't suit these hens or the feed either. Here are 250 hens and we are buying eggs! This can't be the way to care for hens. If everybody does as we do, there would not be an egg to be bought.

Next day happened to be market day and on the list of supplies was 6 eggs. Father read the list over and when he read 6 eggs, he said: "Here I have 250 hens and have to buy eggs." I thought it a good time to make my spent figuring out what these hens need, instead of finding fault with the hens we might be getting somewhere."

The day's mail brought a couple of farm papers. As soon as I found time I looked them over. I found just what I was looking for: two articles on the care of the farm flock and an advertisement of a poultry paper, one whole year's subscription for 75 cents, two years \$1.00. I did not read far before I found what I said was true. We were not feeding or housing our hens right. No wonder they did not lay!

CHICKS *Thrive* on VITAMINES

THEY grow strong, rugged and vigorous when fed Sucrene Buttermilk Chick Mash—the feed rich in vitamins. These vitamins promote health and energy in chicks rapidly developing them in growth and feather to early egg laying maturity.

SUCRENE BUTTERMILK CHICK MASH

will help you raise the greatest possible number of chicks whether home hatched or bought from the chick hatchery. It eliminates all chances of bowel trouble so common when chicks are not properly fed. Pullets raised on Sucrene Buttermilk Chick Mash reach early maturity and become good layers, on account of their healthy constitution and vigor developed by the vitamins in this feed.

SUCRENE BUTTERMILK EGG MASH

puts your hens in excellent laying condition. This ration, rich in vitamins, develops their vigor and vitality, enabling them to maintain a super egg production at all seasons. It also assures good hatches of healthy, vigorous chicks from eggs laid by hens fed on this "vitamine" feed. Fed on Sucrene Buttermilk Egg Mash your hens will give you twice the egg production that they can give on ordinary grain feed—in fact the poultry man who uses these two "vitamine" feeds will reap a harvest in greater egg production and more and better chicks raised.

Prepared by feed experts in our \$2,000,000.00 plant Sucrene Buttermilk Chick Mash and Sucrene Buttermilk Egg Mash are composed only of the finest feeding materials including dried buttermilk and meat meal. Guaranteed analysis on every bag.

Try these "vitamine" feeds today. Take the coupon to your dealer. If he cannot supply you, mail coupon to us. Both sold at same price, \$2.85 per 100 lbs., at the mill which is centrally located and assures prompt service at lowest freight rates.

Dr. David Roberts Poultry Tablets

A combination of sulphocarbolates of calcium, sodium and zinc for the treatment and prevention of White Diarrhea and all intestinal infections of baby chicks, as well as poultry in all stages of life and productivity. Drinking water for poultry should be medicated to overcome and prevent disease. The annual poultry loss by disease is stupendous—over 50 per cent.

Save Your Chicks

Serve in fresh water. Aids digestion. Permits food to nourish them through their babyhood, the non-productive period when hardy bone and strong muscle is needed to give them a good start in their race for the laying period. They will reward you manifold later on. Give them proper protection and you will find there is big money in poultry. Sold in tablet form.

50 Tablets 50 Cents

Poultry will drink when too sick to eat. Baby chick organs are peculiarly sensitive. They need something to ward off disease, particularly that most dreaded and destructive disease white diarrhea.

A Tablet A Day

Keeps Disease Away

One package, 50 tablets, enough to medicate 50 gallons of water, a most effective and economical preventive, for only one cent a gallon. Use Dr. David Roberts Poultry Tonic, Louse Powder, Poultry Cholera Medicine, Poultry Roup Paste and Disinfectant, all known and tried prescriptions. Sold by our druggist, dealer, or direct. Dr. David Roberts Practical Home Veterinarian, a veterinary doctor book, regular price \$1.00, tells you how to treat your own poultry, also describes our 44 prescriptions—a prescription for every animal ailment. We will tell you how to get it FREE.

Our Special Introductory Offer

Send 25 cents, just one-half the regular price, for one package Dr. David Roberts Poultry Tablets, sent you postpaid, providing you give us the name of your druggist or dealer.

**DR. DAVID ROBERTS
VETERINARY CO.**

131 Grand St., Waukesha, Wis.

I immediately subscribed for this paper and from that day to this have been studying the wants of the hen. I have found many hints in poultry papers that have gone a long way toward helping me solve many a hard problem. I have found the hen wants a clean, dry, well ventilated quarters. She wants a balanced ration, a variety on her menu every day, regularity in feeding hours and her working days of equal length the year 'round.

Today I own half interest in the chickens. We have a semi-monitor house for the hens and little colony houses for the growing birds. And above all we have since had enough eggs for home use, besides supplying a good city trade in the bargain.

New Jersey. H. Lurena Hellings.

Chickens Pay On a City Lot.

My first step was to make good yards and houses. I fenced off twenty feet across the rear of my lot, dividing this into three pens. Along the lower part of the fence posts, I nailed a twelve inch plank, the lower edge of which rested about two inches below the surface of the ground. At the top of the posts, I used a two by four inch runner. For my fencing, I used galvanized chicken wire six feet wide, with suitable framing, and with the same kind of wire netting I made an entire cover over my pens. The object of this was to exclude the neighbors' cats.

I have twelve Black Minorca hens and a male in one pen. This pen I keep securely padlocked so that strangers may only admire my beautiful birds through the wire. In one of the other pens I have eighteen White Leghorn hens and a male. These are very good layers, but not as steady as my Minorcas. In my third pen I have eight Barred Plymouth Rocks, six Rhode Island Reds, and four Buff Cochins. These, I keep mostly for setting purposes.

I do not raise my chickens with the hens. As soon as they are hatched, I put them in a brooder, which is made out of a large box. On the inside of the cover I tack strips of flannel or old pieces of blanket, and make them long enough to come down to the straw covering kept in the bottom of the box. This keeps the chicks warm and will take care of three to four times as many as could a hen in the same space.

In one side of the brooder I have a small door. This door opens into a runway made by taking four small posts and nailing on laths longitudinally, and across the top. Thus the brooder and runway are portable and can be moved from place to place as occasion requires.

In this manner I have raised over three hundred chickens in one season. On rainy days when my chicks are small I set their brooders in the wood shed or on the back porch. My losses do not average more than one or two out of a brood.

From my Black Minorca pen I get from five to eleven eggs a day, and even in the off season I can always be sure of getting one and two. I sell seven and eight dozen eggs a week besides having all I can use for my own family.

Chicks—Eggs ANCONAS

It's a safe investment to buy chicks or eggs of me. Sheppard's Strain stands supreme as America's most wonderful layers and exhibition quality. Chicks, 25, \$7.25; 50, \$13.75; 100, \$25.00. "Helps Poultry Profits"

Profitable Poultry Advertising—the poultryman's safe, sure helper, helps any breeder to more business, bigger profits. Planned, written, printed by experienced poultrymen. Classified ads, catalogs, "catchy" envelope to catalog cover designs. Rates reasonable, just state your advertising needs. Poultry Service, Box 33-D, Dodgeville, Wis.

In the morning I feed bran mash mixed up with warm water, and green food, lettuce and kale, which I raise in the back and side yard. At night I give wheat and corn mixed. Once a week I get a few scraps from the butcher for them, and they get all the scraps from the table. For the little chicks, I grind up a little raw meat for them once in a while, which will prevent their picking each other, also picking out their own feathers.

The house and yards are raked once a week, and I give my chickens fresh water at least twice a day, into which occasionally I put a cake of sulphur. I use lime and whitewash liberally in the houses, and I have very little trouble with chicken lice. Occasionally I use a little coal oil on the perches.

My neighbors all tell me that I am having fool's luck. But I do not see it that way. I believe that it is the care that I give my chickens that has made them a success and my yards one of the show places of the neighborhood.

California Evelyn M. Sellman.

A Salary from the Farm Flock.

Having been a teacher at one time in my life, the notion kept occurring to me that it would be interesting, now that I was living in the country, to see if an average sized flock of farm hens could not be made to pay net returns for spare time equal to the meagre salary of a high school teacher. My neighbors, who had always lived on farms, scoffed at the idea of money in hens, and dubbed our first new poultry house, accommodating less than a hundred hens, a "Chicken-hotel". But that was six years ago. There are now a dozen or more new chicken hotels in the neighborhood.

After five years of hard work and study and many mistakes, my books showed, at the end of 1920 that our flock of pure-bred White Wyandottes, averaging 96 hens and pullets, had returned a gross income of \$1060.00, besides the increase in stock. The returns came in, rather evenly distributed thru the year, in the manner of a monthly pay check, managed in the following way:

In February and March we set two 250-egg incubators so that we had a bunch of uniform, well-matured pullets, laying in the early fall. In November, 1920, our 168 hens and pullets laid 1606 eggs; in December 2472, an average of 14.7 eggs per bird, making a net profit of \$98.26 for the month. In January they laid 2666 eggs, and in February 2686, an average of 15.9 eggs per bird for the two months, without a death in the flocks during the four months. We felt that it was an unusually good winter record.

We were assured by poultry experts at the Kentucky Agricultural College, to whom we were sending in monthly reports, that the record was one that we could hardly hope to equal every year. The elements that combined to bring us such luck were a breed that pays no attention to cold weather when housed at all decently, a laying strain of that breed, a healthy flock culled and fed according to the recommendations of the poultry department of the State University, a mild open winter and an abundance of

Wilson's Trap-Nested Stock WHITE LEGHORN Baby Chicks and Eggs

All chicks and eggs we offer are from trap-nested hens that have proved ability to produce offspring of same or better laying capacity. That's why my stock makes such big records and why customers buy from me year after year. My stock made a clean sweep at the January Chicago show, making the fourth straight win for cockerels.

Science Discovers Greatest Lice Killer

Changes Old Methods. No Dusting or Spraying. Birds Delouse Themselves. Gives Lasting Relief.

A recent discovery promises to revolutionize all the methods accepted up to now for keeping poultry free from lice and mites. This wonderful lice killer keeps the birds always lice free without the poultry raiser doing any work. It is the simplest, easiest, surest and best method ever discovered.

Hick's Lice Kill, which is the name of this sensational lice killer, is added to the drinking water. The medicine taken into the system of the bird comes out through the pores and every louse or mite dies or leaves the body. It does not injure the hatchability or flavor of the eggs or meat; is harmless to chicks and does not affect the plumage. A few days treatment at the start and then a little in the drinking water each month.

A Trial Costs You Nothing

So confident is Mr. Hick that Hick's Lice Kill will kill every louse or mite, that he is making a special guaranteed offer of two regular full sized, double strength, \$1.00 bottles and a regular \$1.00 package of Hick's Egg-Lay Tablets all for \$1.00. Use one bottle yourself and sell the other at one dollar, thus getting your own free. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 213, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after two weeks trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

STRONG HEALTHY CHICKS

A conditioner for chicks—
aids digestion and assimilation
of food—insuring rapid
growth, making great big

heavy chickens ready for market several weeks in advance of flocks fed in the usual way. *This means big profit for you.*

Nova-Dex positively prevents gapes, roup, diarrhea, and intestinal worms. You can save your chicks from fatal disease by mixing **Nova-Dex** in their daily feed. Disease is easily and cheaply prevented, but costly to cure. One cent's worth **Nova-Dex** sufficient for one feeding 50 to 75 chicks.

Nova-Dex is also invaluable for growing turkeys, geese, guineas, capons and pigeons. **Nova-Dex** is guaranteed to be exactly as represented—Purchaser must be satisfied or money will be refunded. Price \$1.00 per package postpaid. Agents Wanted.

Phillips Single Comb BUFF LEGHORNS

I have been breeding them for eight years and have accomplished three things: good, even golden color; a strain that lays at four months, can furnish affidavit from one of last year's customers; and have lots of birds good enough for any show room. Write for information and prices by setting and 100 lot.
S. W. PHILLIPS, MATTOON, ILL.

green rye around the houses. So there are four months accounted for with market eggs to sell at winter prices. By March the success of our flock was pretty well known, locally, and, with a little advertising we were able to profitably sell all our surplus hatching eggs during the three spring months.

In May and June we had some 200 cockerels to sell as fryers at a time when they bring top prices. We also sold market eggs.

In July and August we culled out all the hens and cockerels we did not want to keep over another year, and had these to sell in addition to market eggs, some cull pullets and a few more cull cockerels.

In September and October the hens that we had kept were laying to the tune of about 40 per cent; pullet eggs were showing up in increasing quantities; and we had a small surplus of choice cockerels and pullets to sell as breeders. So, by the use of incubators and coal-burning brooders we manage to have poultry and eggs to sell at the time when they bring the highest prices, and in proportion to the size of our flock a very substantial salary, paid by the hens, every month in the year.

Kentucky. Mrs. J. T. Wilson.

Fertile Eggs.

Now is the time to prepare our fowls for the breeding season, if we are to have those high priced eggs next fall and winter.

Early cockerels as a rule make fine breeders when placed with yearling hens.

Vigorous, purebred poultry is the foundation of a supply of fine quality fertile hatching eggs. But the condition of the breeding birds, at the time of mating is also largely responsible for fertility or lack of it. The male bird may fertilize the egg of the female but unless the birds are in proper breeding condition, the germs will be so weak that they die in the early stages of incubation. In other words, fine birds cannot develop anything like their full efficiency, if hampered by improper care.

The ideal way to handle the breeding birds is to give them a rest after the moult and not encourage egg production until a few weeks prior to mating time. I have found that hens are best for breeding purposes. Their eggs hatch best and the chicks are better in every respect. If matured pullets are used they should be the largest and best of the flock, and the pullets should have been laying at least two months.

In conditioning breeding stock considerable importance must be laid on feeding and inducing the fowls to take plenty of exercise. I have found three feeds most valuable in feeding for high fertility. They are ground oats, wheat bran and sprouted oats. They furnish bulk which is very important to the health of the fowls. Bran and oats are also highly nutritious. I prefer to give breeding birds sour milk or buttermilk in place of beef scraps. In my experiments I have not had as good a results in getting fertile eggs with a wet mash as with a dry mash.

Kills Hatching

Many fanciers now use Egg-O-Latum, the great egg preserver, on all eggs for the market. It not only keeps them fresh but prevents hatching, thus protecting against the pirates who watch to obtain high grade hatching stock at market prices. Rub on—wipe off—does not show—Eggs will never hatch but keep fresh longer.

Egg-O-Latum is a soft, white, cerate wax odorless, tasteless, harmless. Applied by simply coating palms of the hands, then rubbing on eggs, a dozen a minute. Keeps eggs fresh one year. A 50c jar enough for 50 dozen eggs, \$1 jar for 200 dozen. If no dealer, order by card. Postman will collect. No. extra charge. Handy as 'phoning.

Better printing for price was never done. No other kind of printing done. No sample sent out. Order direct from this ad. **J. R. HUDSON, Printer, Hardin Springs, Ky.**

I have found the following dry mash to give splendid results; I mix it in about these proportions: two parts each of bran and ground oats and one of corn meal. Leave this before the fowls from noon until dark. Sprouted oats are best fed at noon before the dry mash hoppers are opened. If desired the scratch grains can be mixed in these proportions: three parts each by weight of wheat and cracked corn, and one part of whole oats. A pint of this scratch grain morning and evening, scattered in deep litter, is sufficient for a pen of a dozen fowls.

Whenever possible give breeding birds free range. Scratching in litter and earth is a splendid form of exercise.

Eggs intended for incubation should be kept in a cool room of about 60 degrees F., and turned daily. No eggs should be set that are over ten days old, because too much moisture will have been lost, which can never be replaced, regardless of the humidity of the incubator.

Other things being equal the fertility runs somewhat higher during the warm, sunny days of spring, than it does during the late winter. But on the other hand late winter hatched chickens are more robust and vigorous, due principally to the fact that the birds are of good size before the real hot days of summer arrive.

Ohio Francis F. Murphy.

Black Giants.

There is considerable interest in this variety, and people want to know what the birds are like, what points the leading breeders are working for, how the birds should be judged and mated. It appears that the same kind of a bird is selected for breeding as is selected for exhibition, therefore, the following comments by M. L. Chapman, secretary of the Black Giant Club, should be helpful at this season:

Mr. Maloney, myself and others had considerable talk about the Black Giants at the Newark show. This discussion at Newark helped to develop some general ideas about what the exhibition Black Giant should be. I will enumerate a few of these things, as nearly as I can.

There was considerable curiosity as to why the second pullet did not win first. It afterwards developed that the bottom of one of the toes had a little black instead of yellow. Now our Standard calls for yellow on the bottom of the feet, but inasmuch as it is not a section that contributes to the beauty of the bird, and as long as the bottom of the foot was generally yellow, I think it ought to be considered sufficient in that section. For instance, I would not set back a pullet that excelled in size, color, shape, and in every section, just because she had a little black on the bottom of one toe, and then let a pullet win that was inferior in all these sections, but that simply excelled in the yellow color of the bottom of its one foot. Birds, as judged in our American shows, are not judged solely as market poultry, or solely as layers, although these things may have some influence on the judge's decision. These are the paramount issues of breed type, surface color, head points, bone, size, etc., to be considered together.

Then we come to the question of size. Now in the Jersey Black Giants, I think it can be accepted as a fact that large size is one of their fancy qualities. Of course, I don't expect the judge to carry a pair of scales and weigh every bird, but you know what I mean. A nice, smooth turned, very symmetrical, eight-pound cockerel, ought not to win over an eleven-pound cockerel that is not quite so nice in shape, but has many other characteristics that go to make a good Giant. Of course, where the birds are nearly equal in size, the most symmetrical bird should win. But it might happen that a very large bird would be so ungainly you would be justified in awarding the prize to a bird that was a little smaller than a Giant really should be,

Biggest Hatches Strongest Chicks

JOSEPH LEMKE

18 Burr Oak Ave.
MELROSE PARK
ILLINOIS

but that had splendid type and other desirable qualities.

I want to speak briefly about the question of color. Nearly all the male birds have some sheen; some being a green sheen that is very desirable; some have purple sheen, undesirable; and then there is what I would describe as soot colored birds, just a dull black without sheen of any kind. Now of course the green sheen is preferable, and the soot color next, and the bird with a purple sheen is undesirable.

The females, in color, average better than the males. They are not so apt to come with off-colored feathers; and, if they have any sheen, it is pretty apt to be a green sheen. I have seen some females of a dull black or soot color that look pretty nice.

Now about the undercolor: Undercolor, as described in our proposed standard, is "dull black." However, after talking with as many breeders as possible, I think that what we will eventually ask for is "black shading to ash color at the skin," with the idea that this is less liable to show dark color at the skin or dark pin feathers, making a better market bird. In judging, however, at this time, until we get more definite expressions from the breeders on this point, I do not believe we should pay much attention to undercolor. I would judge them mostly on shape, size, surface color, etc. Birds may have light undercolor, or dark undercolor—I would not let that influence me at this time.

Now take up the question of the color of the skin and the legs. In defects, the first thing mentioned is white skin. A female that has been laying heavily will be faded a little bit in the skin, and I believe a little allowance should be made if a very superior female is a little pale in the skin, and you show that she is in heavy laying condition, I would assume that in prime show condition her skin would be O. K. I will further illustrate this by mentioning a hen I showed at Syracuse Fair. There are occasionally in any of our breeds, hens that are naturally heavy layers. I had a hen that was a fine layer, and she laid right up to and including the week of the fair when I showed her. Drevensstedt did not give her any award, because she showed white skin and white on the bottoms of her feet. When this hen stopped laying, however, her color came back to all you could desire. This, of course, could never apply to a male bird. He should have yellow skin and yellow on the bottom of the feet. Some old birds will fade a little in the color of the shank; that is, they will not have as dark a shank as we would like, but it is not considered as a very serious thing in an old bird.

Now I want to take up the question of disqualifications. The proposed standard does not list any disqualifications. However, in judging at the Garden last year, Mr. Schwab asked the breeders that were around whether they wanted the birds disqualified that had side sprigs and stubs. They said "yes," and he judged a class and threw out a good many birds on that account. After he had gone through a couple of classes, they began to weaken a little bit, and they wanted him to reconsider his decisions on that point. However, having started that way, he would not change, in which I think he showed good judgment. I think we may eventually have some disqualifications, but, as there seems to be some difference of opinion on this matter, it might be well to go a little easy on this point this year. Just at this time, a strict enforcement of a disqualification would probably be in favor of Mr. Maloney and myself, because our birds will be looked over carefully and stubs, etc., will be taken out. It might happen, however, that some new exhibitor would have a very fine bird that should win, barring a little down between the toes or some such slight defect, and it might be well to let such a bird win. Possibly it might be well for a judge to ask the assembled breeders what they want done about this before he starts. Personally, I don't care, either way suits me.

One other thing I would like to speak of that I have noticed at some of the shows this year: A good many Giants come with high tails, and I have seen some specimens that have had about all the tail pulled out in order to hide this defect. This is a thing I would not overlook. I would not place a bird high up in the awards that is minus a good part of the tail, because you cannot tell just how the tail would set if it were all there.

White Crested Black Polish.

I will say to the readers of the American Poultry Journal that the Seelys have bred White Crested Black Polish since 1845, when my father, Isaac Seely, received a sitting of eggs by stage coach from Catskill, N. Y., over 100 miles, as railroads were unknown in this section in those days. We raised Polish on our farm for years and found them good layers, very tame and also ornamental.

Post's Super Anconas

The National Egg Champions and Show Winners. Winners of more firsts, specials and cups than any other breeder in North America. In November, 1921 won highest pen, silver cup, and 5 highest individuals, a grand defeat over 800 head of the greatest egg laying strains in North America, at the Illinois Egg Laying Contest. In December, 1921, we again won highest pen, silver cup, defeating 800 head, also 3 highest individuals. Super Anconas again took highest pen, silver cup and highest individual, over all Mediterranean classes in January, 1922. February sees our strain still leading by several dozens of eggs, all pens competing, and two other pens of our Anconas are in the lead in other Official Egg Contests.

POST'S SUPER COMBINATION EGG AND SHOW STRAIN is the only strain built up from Official Egg Champions, and carried blood and Mediterranean classes in January, 1922. February sees our strain still leading by several dozens of eggs, all pens competing, and two other pens of our Anconas are in the lead in other Official Egg Contests.

Feed *Vitality* and watch it grow!

Don't let baby chicks die because of improper feed

In this advanced age there is no excuse for losing chicks that have been properly hatched and that first see the light of day in a physical condition of vigor, stamina and vitality as perfect as Nature can provide. Nevertheless, it is a fact that millions of such chicks are lost every season because of faulty feeding methods.

Vitality Chick Mash

With Dried Buttermilk

will correct this evil. It is easily digested and will give chicks a good start. The DRIED BUTTERMILK content serves as the greatest bowel regulator and tissue builder known to modern science. It also makes the other ingredients many times more nutritious. We can guarantee VITALITY CHICK MASH because we maintain uniformly high standards of quality for the ingredients and mix them to produce a perfectly balanced ration when fed as we recommend.

Write Mr. Whitney

the Vitality Poultry Expert, and he will help you solve your poultry problems. In addition to being a practical poultryman, Mr. Whitney is a former Editor of Poultry Departments in a number of the leading metropolitan newspapers. During that time he visited hundreds of big poultry farms throughout the country. Few poultrymen have had the opportunity to observe the methods and practices of the successful as has Mr. Whitney. His advice is free.

FREE "The Vee League" and "Eggs Is Eggs"

The April issue of our monthly poultry paper, "The Vee League," contains a complete outline of the VITALITY SYSTEM OF CHICK RAISING and many additional facts of value at this season. Write for it today. Also copy of the VITALITY POULTRY MANUAL, "Eggs Is Eggs." This booklet explains fully how to raise chickens of great vitality and how to feed laying hens for the greatest profit. Just fill out the coupon below and mail today. No money required.

Money Back Guarantee

Thousands of poultry raisers are today making hens profitable through the use of VITALITY FEEDS. So confident are we that a trial will convince others of this fact, that we do not hesitate to guarantee satisfaction or money back. All we ask is that the VITALITY SYSTEM OF FEEDING be given a fair trial. If you do this and VITALITY FAILS, we will cheerfully refund your money.

KILL THEM ALL

Every Rat and Mouse easily destroyed by New Discovery
Not a Poison

Absolute freedom from rats and mice is now assured everyone. No more trapping and poisoning just a few. Clean out the whole bunch, old, young, big and little.

Hick's Rat Killer kills every rat or mouse on your place. Most wonderful of all it does not harm anything but rats, mice, gophers, and other rodents. It is harmless to children, pets, poultry and all kinds of stock. It can be spread anywhere and will kill only rats and mice. This death bringing disease rapidly spreads and quickly destroys all the rats and mice. There is no smell or odor for they run outside for water and die away from the building.

A Trial Costs You Nothing

Mr. Hick is offering everyone troubled with these pests the chance to get rid of them at no cost to themselves. He will send three large double strength, one dollar bottles for the price of one. You keep one for yourself; the other two you sell to your neighbors at one dollar each, thus getting your own free and in addition making a dollar profit. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 883, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after two weeks trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

GOLDEN CAMPINES

Bred from my pens of Palace and Garden winners. Blue ribbon winners at Madison Square including 1920, 1921, 1922. Hatching Eggs.

Mrs. W. B. Brainerd R. D. Ulster Park, N. Y.

The readers of the A. P. J. have known for years that Seely was the veteran Polish breeder of America and I suppose wonder why I have kept this variety all these years. It is simply because they are good layers and bear confinement, and a four-foot lath or wire fence will confine them on any lawn, and they are certainly the most ornamental breed of fowls grown today.

Now let me say to the readers of the American Poultry Journal that the secret in raising Polish chicks and fowls is to keep them dry and clean and free from lice which kills more chicks than any other thing. Some people complain that they cannot raise Polish chicks. It is because the little chicks, when a week or two old, have head lice and also body lice and the lice use them up, whereas, if they would attend to them as soon as hatched they would grow and develop the same as other breeds of chicks. A Polish chick when first hatched has a coat of white down on breast and part of body, which grows off when the first feathers begin to grow, which is from 3 to 4 weeks. The feathers in wings will be tipped with white until the birds are three months old, when they gradually molt out their chick feathers and mature plumage comes in black.

In feeding young chicks use any small chick feed of a dry nature, not sticky or starchy, and after the chick is a month old, any kind of scratch feed, cracked corn, pin-head oats or oatmeal is all right. At the same time watch out for vermin. Cut straw for litter and use in a dry room or shed for the little ones to scratch in and hunt for their feed.

I have kept up the size or quality of my stock by selecting the most promising young birds; those that conform in shape and size to the Polish Standard, and by breeding from these. Never breed from a Polish or in fact any kind of a fowl that lacks in vigor or has any kind of major defect. Often time a chicken will develop white-tips in wings, caused by slow growth, confinement or lice, but that same bird, when she molts as a hen, if well cared for, will have solid black feathers, except in the crest.

Having bred Polish and shown them at New York and Boston, also the World's Fair, St. Louis, and at many other shows, I take increasing pride in the fact that my fowls show better quality than forty years ago; they are larger and more vigorous. I have bred several kinds of Polish, also Hamburgs, White Wyandottes and R. I. Reds, and I find that my W. C. B. Polish lay as well or better than any other fowl; but remember to keep them dry and clean and free from lice. As the writer of these remarks is in his 83rd year, you will excuse anything he has omitted in relation to the Polish fowls. New York. Chas. L. Seely.

Revision Committee Prepares 1923 Standard.

(Continued from page 465)

ture of these feathers corresponds in a way with the character of the feathers in a male's hackle, so it was decided to describe the female as having a hackle.

Stub as well as stubbs are to disqualify; also down shall disqualify.

What is faking and what is legitimate conditioning are to be more carefully defined and elaborated.

Twisted wing, when primaries fold on the outside of the secondaries is to be a disqualification.

A split wing, irregularly formed, so that a distinct gap shows between primaries and secondaries, is to disqualify.

Wattles and ear lobes are to be made two separate sections in all scales of points and all Standard descriptions.

Double spurs or absence of spurs on cocks, or long spurs on hens are to be made defects. Dehorned cattle do not win. And this rule on spurs will check up on soft spurred strains, also the arresting of spur growth on late hatched cockerels.

Thigh—A new description of this term. The thigh of a chicken lies under the skin. It is an error to term the drum stick the thigh. This joint, therefore, is to be known as the lower thigh. Upper thigh will be the part under the skin. An illustration is to be introduced into the introductory pages of the Standard to explain the peculiar anatomy of a chicken's leg.

CUTTING FOR DEFECTS

Slate in buff varieties is to be cut up to the limit of the value of the color section.

An extra spike on a rose comb is to be cut one-half point more than in present Standard.

Mealiness is to be cut up to 2 points. Irregular or deficient penciling is to be cut up to 2 points.

Wrong color of eye to be cut up to 1 point for each eye.

KIDD'S SINGLE COMB DARK Brown Leghorns

Winners Chicago National Chicago Coliseum, Iowa State Show, Sweepstakes Pullet Iowa State Fair, and Champion Cock of Cedar Rapids Poultry Show. Five pens this year all from exhibition and trap-nested stock. Eggs for hatching, Pen 1, \$5.00 per 15; other pens, \$3.00 per 15. A few females for sale. Satisfaction guaranteed.

CARL W. KIDD,

332 Fifth Ave., West, Cedar Rapids, Ia.

Pinched or gamey tails in Leghorns to be cut up to 2 points.

Black in bill of ducks to be cut up to 2 points.

NEW VARIETIES

A resolution was adopted in favor of not dividing varieties into sub-varieties on the basis of shades of color. This does not affect the present Standard for Light and Dark Brown Leghorns but is intended to represent the attitude of Standard Committee regarding the proposed division of Barred Plymouth Rocks into two varieties.

A new preamble written for Plymouth Rocks describing the pullet-bred male and cockerel-bred female, from a breeding standpoint, and explaining the differences in barring between these breeding birds and the Standard exhibition birds which they help to produce. While the committee does not recognize two varieties of Barred Plymouth Rocks, it meets, in the above way, the rather general desire of the new breeders to learn something of the pullet-bred male and cockerel-bred female.

Recommended that Rose Comb Barred Rocks be not admitted to the Standard, since the rose comb is not a character of the Plymouth Rock breed.

Recommended that Single and Rose Comb Rhode Island Whites be not admitted to the Standard.

Do not let anyone think that these matters were passed over lightly. They were argued pro and con for hours; considered and reconsidered. It is not an exaggeration to say that the R. I. White issue was actually fought out in the committee.

Although the R. I. White Club has a thousand members and the admission of the breed would mean the sale of at least a thousand additional copies of the Standard, it was felt by a majority of the committee that the varieties lacked characteristics that would readily distinguish these fowls. While it is maintained that a great deal of money is invested in this breed, it is a fact that anyone who invests in a non-standard breed or variety gambles on the future of that variety, and must be prepared for disappointment.

Recommended that Black Giants be not admitted to the Standard on account of similarity in breed characteristics with Black Javas. It appeared that the Giant Standard called for the same single comb, black eyes, black plumage and black shanks with yellow bottoms to feet that are called for in the old Black Java. We are not saying how this writer voted on this issue or how the other members of the committee voted, for that is confidential, but we are endeavoring to give you the salient reasons which enter into the whys and wherefores.

The vote on Rhode Island Whites was reconsidered and the Rose Comb variety would have passed and been approved if it had not been for the single comb variety which proved too heavy a kite.

Black Rhinelanders and White Missouri Fluffs, two breeds admitted within recent years by the A. P. A. were considered as not entitled to a place in the 1923 Standard, as dissemination of the two breeds had ceased, and it is recommended that they be declared obsolete and not included in the 1923 Standard.

ILLUSTRATIONS

New illustrations were ordered from Artist A. O. Schilling for Barred, White, Buff, Partridge, Silver Penciled and Columbian Plymouth Rocks. Silver Penciled Wyandottes are to be illustrated. A new Light Brahma male picture is to be made. New pictures also for Light and Dark Brown Leghorns, Single and Rose Comb White Leghorns, and Single Comb Buff Leghorns. Effort will be made to arrange with the Blue Andalusian Club for new pictures. Anconas are to have new pictures, male and female. Spanish pictures are to be altered. Orpington and Sussex pictures are to be modernized. W. C. Black Polish male pictures to be corrected. Entirely new pictures for Silver Spangled Hamburgs. Tail of Houdan female to be lowered in picture. Silver Campine male picture to be improved; head on female to be made trifle larger. Pekin duck pictures to be changed to carry a trifle less upright Runner type and trifle more Aylesbury type. Many slight alterations are to be made in other pictures of different breeds. Mr. Schilling offered to present to the association without cost pictures for the Standard of male and female, Mille Fleur Bantams, Silkies and Frizzles which will be acceptable.

In glossary a new barred feather is to be shown; a new laced feather showing larger, more oval type, and larger penciled feather of the crescentic type of penciling as the little laced and penciled feathers are no longer considered as representative of the best quality. A Buttercup and Chanticleer head are to be shown. A new diagram for measuring the angle of tail is to be shown, so that tails may

TORONTO, CANADA**

be measured by profile instead of by second main tail feather.

In the Mille Fleurs (a thousand flowers) you have one of the most unique color patterns in the Standard, and in the Silkies and Frizzles you have two of the most unique feather structures in the Standard, and it is appropriate that they should be illustrated, and Mr. Schilling's generous offer to provide the pictures will contribute to the educational value of the Standard. If originators of so-called new breeds knew what remarkable creations are already established breeds they might become breeders and stop experimenting.

BREED STANDARDS

The committee approved dividing the general Standard into breed Standards, same to be sold at 50 cents to \$1 the copy. Inasmuch as the committee approved breed Standards to be sold at a nominal price, and accepted the recommendations of the Leghorn Clubs in the matter of breed type and illustrations, A. F. Rolf, Secretary of the National White Leghorn club, stated that that club would not issue a separate specialty Standard, and would confine its efforts to putting out a leaflet for general distribution, boosting the modern purebred Standard bird, illustrated by present-day winners at leading shows, to "promote the real Standard Leghorn against the common non-descript Leghorn now being widely sold."

Lyle Funk spoke to several members of the committee as follows: "I am discouraged with big combed, brassy backed, high tailed Leghorns and I am through with them. Not that I am going to quit breeding for eggs. That is not necessary. A year ago I picked the twenty best Standard females on my farm. One of them laid 237 eggs, one did not lay and with her omitted the average production was 188 eggs. You have heard of higher records. Let me tell you that a man who

averages 150 eggs for his flock is not only doing well, but on a profitable money-making basis. No chicken is 'all eggs.' The pendulum may swing high, but it will swing back and the law of balance remains true. We know this to be true. We are corn breeders as well as poultry breeders. The normal oil content of corn is a trifle over 4 per cent. We figured that if we could double this oil content a half bushel of our corn would have food value equivalent to one bushel of ordinary corn. We increased the oil content to over 7%, succeeding in that direction, but our yield of corn decreased nearly 50 per cent, so we were right where we started."

Mr. Funk's talk supplemented by pedigree egg birds from the U. S. Department of Agriculture's farm, in care of Harry Lamon, A. F. Rolf, Frank Rogers, H. V. Tormohlen and A. O. Schilling, effectively dispelled all lingering doubts as to the likelihood of the Standard for Leghorns being revamped along radical lines.

BARRED ROCK CLUB ACTIVE

The American Barred Plymouth Rock Club was ably represented by its president, W. E. Cowan, Secretary Leo. Robinson, and Judge J. C. Johnston. Their petition to divide the Barred Rock varieties into two sub-varieties, Light Barred Rocks and Dark Barred Rocks, was received by the Standard committee; but Chairman Branch ruled that no action could be taken on this matter at this time, as the constitution of the A. P. A. specifically requires that Standards for new varieties must be filed one year before action to adopt or to reject may be taken. This delay of one year will prevent action being taken on this issue at the Knoxville meeting, which will preclude the possibility of the two sub-varieties appearing in the first edition of the 1923 Standard.

PRINCIPLES OF STANDARD MAKING

A new "General Introduction" to the Standard is prepared by John H. Robinson. This introduction covers the principles that underlie Standard making, the principles that determine the recognition of breeds and varieties; and the relation of utility characteristics to Standard types. This introduction as now prepared, is a new departure, and everything that follows in the Standard in regard to breed and variety details, will be illuminated by the statement and explanation of the fundamental principles set forth in the introduction.

QUALITY OF FEATHERS

The wing and tail sections of all breeds except Cornish, etc., are to be described as having broad, overlapping feathers to get away from tendencies to split wings and split tails.

A section to be added to "Instructions to Judges," to the effect that quality of feather depends upon the size and structure of the individual feathers; and it is to be pointed out that a smooth, hard surfaced plumage is secured by a feather, the barbs or ribs of which are completely hooked together. This definition is to explain what is meant by quality of feather in all white, buff and red varieties of the American, Mediterranean and English classes. The importance of a smooth web of feather in these solid colored varieties is not less important than the size of feather on which depends the color pattern in the parti-colored varieties, and this will be pointed out.

CHANGES IN PLYMOUTH ROCKS

Under the present Standard the skull may be as broad as a Brahma's; new Standard to call for cleaner head. Face to be described as smooth. This is a new addition and is an important factor in egg production. Wrinkled, gamey faces, or very broad, heavy skulls not wanted in tentative petition of Barred Rock Club.

Barred Rock Club representative wanted the back slightly rounded at shoulders and Standard committee left back as in present Standard.

In shape of Plymouth Rocks, wing flights and main tail feathers are to be described as broad feathers that lap one over the other, in order to get away from narrow feathering, twisted feathers, etc.

The Columbian Rock female in present Standard is described as having a broad neck feather. In new 1923 Standard, Revision Committee recommends that the Partridge, Columbian and Silver Penciled males be described as having some little width to their hackle feathers, as a narrow feather makes a narrow black stripe, materially changing the surface color of the neck.

The back is to be described under "shape" of the Plymouth Rock breed as having a moderately wide feather; this applying to all varieties of the breed.

Columbian and Light Brahma varieties are to have same color descriptions; Partridge varieties are to have same color descriptions, Silver Penciled and Dark Brahma varieties are to have same color description.

Silver Penciled males are to be described as having a little white or gray in the lower body plumage and slate undercolor shading light at base. Shanks to be yellow.

Distinct penciling in lower female hackle allowed in both Silver Penciled and Partridge females. Shanks of these females to be yellow. If breeders of these varieties are active we fancy they will take note of this. Remember the Revision Committee only makes recommendations; the Knoxville convention will definitely decide. This is an open convention in which every breeder can voice his opinion.

Partridge male is to have a black body with lower body feathers tinged a little with red.

Partridge Wyandotte breeders asked to have rich, brilliant red changed to bright red. This last term is used in describing the color of the comb. To help clean up this color the committee accepted and recommended medium rich, brilliant red.

A great deal of discussion on allowing red shaft in hackle and saddle of Partridge male. As no Partridge club asked for this change no action was taken.

Mahogany-brown to be taken out of Partridge female. Brown was defined as not a primary color, and as requiring the addition of black to produce it. Reddish-brown was about as bad a term for the same reason. A term like deep reddish bay will be used to describe the ground color of the female. E. G. Lapham represented Partridge Wyandotte club.

ASIATICS

See color qualifications in American varieties. Positive enamel white in lobes to disqualify all Asiatics. Paleness of lobe is not to disqualify.

NABOB JUST-RITE Baby Chicks

1,500,000 Chicks in 1922

We have 40 breeds of chicks and 4 breeds of ducklings that are the finest line of poultry that ever graced a poultry yard. We have two grades: Exhibition and select and each is backed up by our iron-clad guarantee.

95% Live Arrival Guaranteed and a Month's Feed FREE—Post Paid

To make real money you must have our chicks. Accept the liberal offer today and start on the road to success as a poultry man. If you pass this offer by we are out nothing, but you may be out the difference between a good chick and a poor one.

Sent by mail postpaid. Order today or send name for complete data of feeders, fountains, coops, egg carriers, canary shelf and breeding cages.

KEIPPER COOPING CO.
1401 FIRST ST. MILWAUKEE, WIS.
EASTERN OFFICE JOHNSTOWN, N.Y.

One Feeder, size B, 12 inches long; also one Chick Fountain, capacity 1 quart, mailed to any address postpaid for \$1.00. You cannot afford to miss this unusual bargain. Order today.

CHICK FEEDER

Black Cochins to have slate undercolor. Black Langshans dull black undercolor.

Undercolor of all sections of Columbian and Light Brahmas bluish slate. Back is to be white; saddle white; same V-shaped ticking in lower saddle from points of wings to sides and base of tail. Top tail feathers of Columbian females to be not laced but edged a little with white.

BUFF COLOR

Rich golden buff is defined in the glossary as not so dark as to be reddish or so light as to appear of a lemon shade, but a modification of orange, having a golden hue. The exact color definition, here abridged, was prepared by Artist A. O. Schilling.

BUCKEYES

Positive enamel white in lobes of Buckeyes to disqualify. One or more white feathers in plumage, whether in outer plumage or wings, to be a disqualification in both Buckeyes and Reds.

BODY AND FLUFF

Many proposed changes regarding "fluff" indicated that many people assume the body feathers to be the fluff. Fluff is composed of the short feathers on abdomen below vent. Feathers on lower thighs and sides of body are not "fluff."

WYANDOTTES

Positive enamel white in lobes of Wyandottes to disqualify. When white was reduced from one-third to one-quarter at last revision, Wyandotte men promised to be ready for the same clause as relates to Plymouth Rocks at this revision.

Back, fluff and shanks of Wyandottes to be moderately short. New preamble written for this breed, to set forth the beauties of each variety. Face to be smooth and clean; not wrinkled or heavy with small white feathers.

Silver and Gold varieties to be known as Silver Laced and Golden Laced Wyandottes. Females of these varieties to have a moderately large feather in back with oval lacing. Ground color of Golden Laced to be described as a

First prize Blue Orpington cockerel at Madison Square Garden, New York, 1922. Owned by Wm. Cook & Son, Scotch Plains, N. J.

First pen White Orpington cockerel at Madison Square Garden, New York, 1922. Owned by Robadel Poultry Farm, Cos Cob, Conn.

shade richer in color to get away from the old, light golden-bay. See Plymouth Rocks and Asiatics for other color types.

RHODE ISLAND REDS

New preface to the Rhode Island Red breed was prepared and the color referred to as not light red or so dark as to have a brownish cast or violet hue.

Positive enamel white in lobes of Reds to disqualify, as in all other breeds in American class. Increase pullet $\frac{1}{2}$ lb. Faces of Red male and female are to be smooth, to get away from gamey faces seen in some females. While Red breeders asked for no changes, the above

are only enough to put their breed on a basis with others in the American class, as they will be described in the new Standard.

In addition, a moderately broad feather will be called for in the saddle of the R. I. Red male. This will make the Red male with a nice web in its saddle feather a better bird than one that carries a narrow, stringy feather in saddle.

SLATE UNDERCOLOR

Black plumaged varieties with black shanks are to have dull black undercolor; those with yellow shanks, slate undercolor. Silver Wyandottes to have slate undercolor; shading to lighter slate at base; Golden Wyandottes to have slate undercolor, shading to red at base.

ORPINGTON

Tail lowered to meet club's recommendations. New preamble prepared, which includes reference to smooth sides free from profusion of long hanging or globular plumage. Back of female to gradually incline to tail instead of having concave sweep. Positive enamel white in lobes to be disqualification, putting Orpingtons on same level as all American breeds. Club asked for slightly tipping forward carriage in Orpingtons; committee was of opinion that this feature had ruined Cochins, and would ruin Orpingtons as a utility breed, so it was not allowed. Shanks

of buffs and whites are to be pinkish white. Blue color to be left as at present, regardless of what changes may be made in Blue Andalusians. D. E. Hale, C. S. Byers and Edgar F. Alden represented the Orpington.

MINORCAS

S. C. Buff Minorca weights increased to S. C. Black weights.

SPANISH

Reference to longer the face the better, stricken out. Face described as deep and smooth. Lobes to extend slightly below wattles. Wattles to be no longer described as ribbon like. A new preface for this breed, calling for a development of the smooth white face to attractive, not grotesque proportions.

ANCONAS

Weights to remain the same. More than 1 lbs. under weight to disqualify. Lobes to be white; creamy white lobes to be a defect. New preamble prepared for this variety, in which uniform distribution of tipping is stated to be desirable. Ancona tipping to be small and sharply defined and in the following proportion; head of both sexes about one feather in three tipped. Back of male, about 1 in 5 tipped. Neck of saddle of male about 1 in 3 tipped. Breast of male, neck, back, breast, body and wingbows of female, about 1 in 2 tipped with white. This will not make a light bird if you get the right size and shape of feather and these characters of feather formation are discussed in the new preamble to the breed. H. C. Sheppard appeared before the committee; and Frank C. Stier asked for practically the same plumage requirements. If the breeders will accept this new color description and new preamble to the breed, they will have one of the most attractive breeds in the Standard. The committee worked hard on this problem. Shanks to be yellow; mottled shanks to be a defect.

DORKINGS

Silver Gray Dorking weights to be made same as colored Dorkings. Little Stipling to be allowed in lower neck of female.

CAMPINES

Instead of black barring in male and female being four times width of white bar, the dark bar is to be three times the width of the white bar. Breasts of both sexes to be barred with black twice the width of the white bar. Tails of both sexes to have tails with bars four to one. Same changes made in golden.

LEGHORNS

Recommend that Red Pyle Leghorns and Rose Comb Buff Leghorns be dropped from the Standard. The Browns are to be recognized in three varieties only; S. C. Dark Brown, S. C. Light Brown, and Rose Comb Brown only. Leghorn weights raised $\frac{1}{2}$ lb. on cock, hen, cockerel and pullet. More than 1 pound under weight to disqualify.

Creamy white lobes in Buff Leghorns to be made a defect. Let up a little on undercolor of Black Leghorns.

Back shape of Leghorn male to be described as having moderately broad and long feather, filling well in front of tail. Under line of male is to be described. Sickles and tail coverts to be described. Good width in tail feathers called for. Shanks to be yellow in White Leghorns instead of rich yellow. Prominent Leghorn men appeared before the committee, such as Schilling, Rogers, Lamon, Rolf and asked for more weight. They want to emphasize under line, body and substance, taking wind out of "utility" Leghorn and slowing down sale of toppy, little, small stuff.

CORNISH

A new paragraph to preamble to be added, citing need for graceful type, and pointing out that Cornish men can spoil breed if Standard type is not adhered to and extreme short, bulldog type is bred. Face is not to be described as rather coarse in texture; while this space is common, it is not to be set up as the Standard ideal. Face is to be described as full and round. The paragraph which reads, "station low," is to be stricken out; and shanks are to be described as "moderately short."

SUSSEX

Artist Schilling is to give wider appearance to the tail of male in Standard picture, so the tail will not look like a shingle stuck in the bird's back. The back is to be described as filling fairly well with saddle and coverts in front of tail, so as not to form too sharp an angle between back and tail. The perfect Dorking type is not altogether ideal for the Sussex, hence the slight modification in the new Standard. Undercolor of Speckles is to be slate shading to salmon shading to gray at base. Under color for Red Sussex is to be red. This writer realizes that slate undercolor has been over done in Red Sussex to the detriment of the variety. Speaking as a breeder, we favor red with a little slate, but do not object to the high ideal of the R. I. Red breeders which have now been adopted by the committee as the Standard undercolor for Sussex.

Rid Hens & Chicks of Lice and Mites

A Few Drops of Wonderful New Remedy in Drinking Water Does It. No Dusting, Spraying or Greasing.

At this season of the year lice and mites cause many poor hatches. Setting hens infested with them will often desert their nests at the most critical time. They sap the strength and vitality of baby chicks. Many dusts, sprays and dips are so strong that they often make eggs unhatchable. Greasing setting hens or baby chicks is disagreeable and unsanitary.

A wonderful new discovery has recently been developed which makes it easy to keep the whole flock, especially setting hens and baby chicks, absolutely free from all lice and mites. Just a few drops of Imperial Lice and Mite Remedy, given occasionally to fowls in drinking water, keeps them entirely free from all vermin. It is a simple remedy in highly concentrated form, and is guaranteed not to affect eggs or flesh of fowls in any way. Lice, mites, ticks and other vermin will not stay on any fowl when this remarkable remedy is used in their drinking water. It is also a splendid spring tonic and blood purifier for the entire flock.

WHITE DIARRHOEA REMEDY FREE

The manufacturers of Imperial Lice and Mite Remedy, in order to get it quickly established and widely used, are making a special introductory offer: In connection with your order for a regular full size (double strength) \$1.00 bottle enough to eliminate all lice and mites from the average flock and keep them free from this vermin, they will include free to you as an outright gift, your choice of either a regular \$1.00 package of Imperial White Diarrhoea Remedy (the standard time tested remedy), or a large size \$1.00 package of Imperial Egg Tonic, the guaranteed egg producer. In ordering, send only \$1.00 (check, M. O. or currency) and state your selection. Both remedies sent postpaid.

If more convenient, you need send no money, just your name and address to the Imperial Laboratories, Dept. 553, 2110 Grand Ave., Kansas City, Mo., and pay the postman \$1.00 and a few cents postage when the package containing the two remedies arrives. As this offer may not appear again you should act at once, or clip for future reference. You need not hesitate in ordering, as you risk no money. The manufacturers guarantee to refund the cost any time within 30 days if you are not entirely satisfied.

Berry's Poultry Farm, Box 115 Clarinda, Iowa

Parasites That Poultry Men Should Know About.

Very few of us realize the losses caused by parasites. A parasite is an insect that preys upon fowl or animal life for its sustenance. There are about thirty-one known species of insects that infest poultry, but I will only touch on the most common ones. A large proportion of deaths of poultry can be attributed either directly or indirectly to parasites. By lowering vitality they render the birds fit subject for all kinds of disease. Though they do not always kill outright, they are a contributing cause. By their continual irritation they disturb digestion, poor assimilation follows and the birds are rendered unfit to withstand any kind of disease which may attack them.

Now, reader, do not misunderstand me. There is a disease called white diarrhea. Only about two weeks ago an elderly lady had a droopy chick and she asked me to examine it. She called it white diarrhea. Of course her eyesight not being good, she could not see the big, long-bodied, six-legged lice on the chick's head, and because the chick had a diarrhea, of which the lice were the cause, she called it white diarrhea. So I say lice will really bring on disease.

The next worst enemy of poultry is the little red mite, and what makes it red is the blood of poultry. They prey upon the poultry at night, and hide in cracks and crevices of the interior of the poultry building during the day. Don't think because your buildings are new that you will not or do not have them. It will not be long until they are filled, if you do not spray. Lift up your perches and examine them where the ends rest and you will find them there in large numbers, if you do not spray. English sparrows are carriers of mites. Keep a watchful eye on the hens and be sure that you detect in time the fact that they need attention. A hen infested with insects is too miserable to give a good account of herself in egg production and it matters not even if you give her a balanced ration and her breeding is the finest, she will not yield a profit. When the chicks begin to come off they are doomed to an early death, for the insects quickly make their way to them and as they have not the resisting power of older birds, few survive.

I have used several kinds of louse powders, but have never found anything so effective as blue ointment mixed with lard. You can buy the 33-1-3 per cent strength blue ointment from your druggist, and then mix two parts lard with every one part blue ointment. Heat the two together until soft, then while cooling stir until quite solid. To apply—spread the fluff just below the vent and with the tips of fingers rub on the skin a pinch about the size of a pea, and the same amount on each thigh. In case of a hen with chicks I also rub a pinch on the breast and breast feathers and I never have had to use any on the chicks while with the hens, as they get enough off the hen.

If head lice get on brooder chicks use lard and carbolic acid. To every teaspoonful of lard add five drops of carbolic acid, and rub on top of the

"Mor-Kik" Chick Feeder

Newest and Most Practical Feeder On the Market

A perfect Feeder for feeding Dry Mash and Grain Feeds to Baby Chicks. It has detachable, adjustable, self-feeding hopper with removable sides for cleaning. It feeds from both sides alike. chicks' head. (Pretty strong. Would prefer to use olive oil and put under beak and on throat as well as on top of head.—Editor.)

To get those insects that infest the houses I use a liquid and a spray pump. The liquid made as follows: One part crude carbolic acid and two parts kerosene. I spray every two weeks in summer and once a month in winter. A good commercial lice paint will get these pests. Lice powder is no good for mites.

It is a mistaken idea that whitewash will kill insects, but if 2 per cent of carbolic acid is added to the whitewash it will kill them. I prefer spraying before applying the whitewash. The destruction of the insect enemies of poultry is not such a big job if the work is undertaken in time. It is just like many other details connected with the work you cannot afford to put off. If you were ever in the swamps in Arkansas in the summer time where chiggers, mosquitoes and many other ill-mannered insects kept you sitting up in bed in the wee hours of night trying to get one minute of rest, you would be like the writer—trying to get Uncle Sam to declare war on every chicken raiser that would not declare war on those pesky chicken lice and mites.

These are only simple treatments that may be helpful to some one as they have been beneficial to me.

Ill. J. E. White.

Rhode Island Reds.

"What a beautiful flock of Rhode Island Reds! Are they pure bred?"

They most certainly are, for we would have nothing else on the place," is invariably my answer to that question. The reasons are obvious. Anyone who has had any experience whatever with poultry will never go back to mongrels after having a nice, uniform flock of purebreds, of whatever breed they may be, on the place.

The question which usually follows is: "But why do you prefer Rhode Island Reds?" and is frequently asked by various persons among the many who visit our yards. My answer to this question has won many converts to the breed and is summed up as follows:

Having tried several other breeds previous to the Rhode Island Reds, we chose them after carefully comparing them from the standpoints of (1) Beauty. There are few people who fail to appreciate a thing that is beautiful. Where in poultrydom can we find a more beautiful sight than a nice-even-colored flock of females with their dark, rich red plumage, yellow legs, and bright red combs, headed by a lordly cock or cockerel with his full, rich red, even colored breast, bottle-green black tail, and shining velvety hackle. Go to the poultry shows and you will always find an admiring crowd in Red alley, for they attract attention wherever they go. The fact that these beautiful even-colored birds are somewhat difficult to produce does not generally discourage the breeder, for he finds it an interesting and extremely fascinating study to produce birds that are as near as possible to that required in the Standard.

Vigor. We have found, after trying at least half a dozen other varieties, of which I mention Orpingtons, Leghorns, Wyandottes, Banded Rocks, White and Black Minorcas, that the R. I. Reds are the most vigorous, energetic and as a consequence the most hardy and free from diseases in general, of any of the varieties mentioned. The baby chicks are less delicate and sensitive and we have less trouble in getting them started than those of any other breed mentioned. They are not readily affected by extremes of heat or cold and are kept in good condition with a minimum of time and labor.

Egg laying qualities. Almost any kind of chicken will lay in spring and summer, the natural breeding season, when eggs are cheap and plentiful, but the bird that will be most in demand is the one that will produce a creditable amount of eggs in winter when eggs are scarce and high. The R. I. Red is sufficiently large and well feathered to withstand the cold weather and if properly cared for will lay all winter. Feed plenty of green

(Continued on page 540)

Keep Down the Louse Pest

It means better fowls, more eggs, better growth in chicks. Chicks are coming along now. Don't let them be pestered to death. Sprinkle Dr. Hess Instant Louse Killer in the feathers, in the nests, on roosts, about pens, coops and yards. Be sure to keep it in the dust bath all the year 'round. That means louse prevention. When setting the hen sprinkle it in the bottom of the nest before adding the litter and the eggs. Then your brood will come off free from lice.

An excellent bug killer to use on cucumber, squash, and melon vines, slugs on roses, etc. Guaranteed.

Trapnested Pedigreed ENGLISH LEGHORNS

Trapnested and linebred six years on our farm. Every nest on our farm is a trapnest. Every chick hatched on our farm is a pedigreed chick. Hundreds of pullets are trapnested here every year. We have mated this year 270 choice breeding hens with trapnest records from 180 to 281 eggs in one year, from which we offer hatching eggs of strong vitality. All breeding stock on open grassy range. Write today for free illustrated mating list, describing our farm and trapnested flock of bred-to-lay White Leghorns. Address BUCKEYE LEGHORN FARM, R. D. 21, AKRON, OHIO.

and 281 eggs in 1 year

SOL-HOT-SUPREMACY

Always in the Lead

Ever since I originated and built the first oil burning wickless Canopy Brooder several years ago (see illustration at right) Sol-Hot Supremacy has been maintained. Like all good things, Sol-Hot has many imitators, but the improvements that have been added from time to time to the original Sol-Hot Wickless Oil Burning Brooder has kept it far in the lead of all others.

This supremacy is not only evident in the comparison of the Sol-Hot with any other Brooder, but it is also plainly evident in the tremendous demand for these brooders by poultry raisers everywhere. Our business has grown by leaps and bounds, particularly the last three years since we have developed the Super Sol-Hot Heater to its present state of perfection. This year our business has more than trebled—we are working day and night to supply the ever fast increasing demand for Sol-Hot Colony Brooders.

The One and Only Brooder With Positive Oil Control

Metal Vaporizer
(Patented)

The new Super Sol-Hot Heater with its positive oil control is exactly what poultrymen have been waiting for and what we have been working for years to perfect—we now have it and no longer need you be troubled and inconvenienced with continual adjustments. The Super Sol-Hot is entirely automatic—you simply light the burner—see that your oil fountain is supplied with oil and no further attention of any kind is required. Sol-Hot won't go out—won't smoke—won't overflow—it burns a uniform even heat all the time, adjusting itself automatically to changing weather conditions. The positive oil feed and auto-

matic oil control is a patented feature and can only be found on the genuine Sol-Hot Heaters—other so-called positive oil feeds are simply the old style "open pipe" methods and they do not control the flame.

Our patent Metal Vaporizers are supplied on all Super Sol-Hot Heaters. This patent device takes the place of the old fashioned asbestos vaporizer that has always been such a source of trouble and annoyance to poultry raisers. Our Metal Vaporizer will not carbonize so easily as the asbestos ring and it only takes a minute to lift them out and clean them, while asbestos vaporizers soon get covered with carbon—flame burns unevenly—flares up on one side and often goes out entirely. Asbestos vaporizers can be used on the Sol-Hot, but we do not recommend them.

End Your Brooder Troubles With SOL-HOT

Order a Super Sol-Hot Canopy Brooder this season—it will prove the best and most satisfying investment you ever made—it will mean an end of your brooder troubles—it will help you rear your chicks without the usual heavy mortality losses. You simply light it and forget it—it doesn't require any attention except to keep it supplied with oil. You can always depend on the faithful Sol-Hot being on the job—24 hours every day. The FIRST
Oil Burning Canopy
Brooder Ever Built
Originated by
H. M. SHEER
Quincy, Ill.

From this original Brooder which was made several years ago the Super Sol-Hot Oil Burning Wickless Canopy Brooder was developed to its present state of perfection.

Famous SHEER Quality

Wafers, Regulators, Gas Valves Etc.

The Acme Compound Wafer Thermostat

A Thermostat expands with heat and contracts with cold. This action of expansion and contraction is the motive power that operates the mechanism of the incubator regulator, thereby controlling the heat in the egg chamber of the incubator, or brooding chamber of the brooder.

It is a well known and established fact that the fluid thermometer is the only accurate and dependable heat indicator.

The patented valve is the keynote to the wonderful efficiency of my Acme Wafer Thermostat.

The Tandem Double-Compound Thermostat

The Tandem Double-Compound Thermostat was designed by me to satisfy an ever increasing need for a sensitive thermostat with greater power and more positive action than those in use. This could not possibly be accomplished by any change in wafer construction, hence my Tandem Double-Compound Thermostat was the only solution to the problem. My Tandem Thermostat is used by most manufacturers of high grade colony brooder stoves.

The Tandem Thermostat is instantly attached to any style of regulator now using a wafer thermostat.

All you need do is to remove your Wafer and insert the Tandem Thermostat in its place and fasten with the screw provided for the purpose.

Acme Regulators (Style E Junior)

Although I have patterns, dies and equipment for manufacturing more than a dozen different styles of complete regulators, I am listing only the following three, for the reason that they embody the essential features of all the others and will meet every requirement. Acme Automatic Regulator—Style "E" Junior—enters end of egg chamber, leaving the top of incubator free of all obstructions. Can be attached to any incubator.

Acme Automatic Regulator (Style D)

The Style "D" is located on top of incubator, and is one of the most popular types in general use.

The action of the thermostat in Style "D" is transmitted to damper lever by a direct upward thrust or push.

Style "C" is another popular type, and is located on top of incubator same as Style "D." The action of the wafer is transmitted to the lever by a downward pull, instead of an upward thrust like Style "D."

Either style will fit any standard make of incubator and give the same satisfactory results. Furnished with either single or tandem thermostats.

THE same high standard of quality that has caused Sol-Hot Heaters and Canopy Brooders to maintain their supremacy is also characteristic of the SHEER line of Thermostats, Regulators, Gas Valves, etc. The precision and accuracy of Sheer equipment—the extra fine quality of material used as well as the superior workmanship is recognized by manufacturers and users alike as the best the market affords.

For example the Tandem Compound Thermostat for use in coal burning brooder stoves are made of tinned steel—experience and tests have proven this material to be much better than brass although we are prepared to furnish them in brass if requested. This Tandem Thermostat is covered by patent 961654 issued to me June 6, 1910. All brooder stoves using the Tandem Regulator must be equipped with the Sheer Wafer Thermostat. Using any other wafer is an infringement of our patents.

Write today for free catalog folder which describes the entire line of Sol-Hot Heaters, Brooders, Regulators, Wafers, etc. Also ask for free folder describing the MULTI-DEK SECTIONAL INCUBATOR, a new idea in a sectional incubator that is very popular. You can build it yourself—a section at a time. Six sections of 250 egg capacity each can be operated with one Sol-Hot Heater. Write for free folder today.

H. M. SHEER CO. QUINCY, ILL.

Dept. 26

The Acme Automatic Gas Valve

This valve will reduce your gas bills fully seventy-five per cent for incubator and brooder use. Raising the lever shuts off the flow of gas; lowering the lever turns on the flow of gas. The adjusting screw is set so that when the lever is down the gas will burn full flame, and when the lever is up, or raised to its full limit, the flame will be turned down as low as it will burn without danger of going out. When connected up with the regulator for incubator or brooder, the size of the flame is controlled automatically, the regulator raising or lowering the lever of the gas valve, decreasing or increasing the size of the flame according to requirements.

The valve is furnished complete as shown in illustration, including burner tip, chimney flange, wall bracket and hose coupling; so that it can be readily connected with your gas service.

DAY-OLD CHIX - DUX

1887-1922

Your Success with poultry, whether an amateur or a professional, will be in the exact proportion of good breeding that stands back of your birds.

Our stock has a priceless heritage of good breeding back of them. THIRTY FIVE YEARS of expert breeding along practical, progressive lines; over sixteen generations selected by the Hogan Test. Highest possible flock average is the result.

W. R. Curtiss Co., Feb. 28, 1922.

Gentlemen: Niagara Falls, N. Y.

From 32 pullets raised from day-old chix purchased of you last season I got the following results in which I thought you might be interested: November, 580 eggs @ 75c per dozen; \$30.00 net profit. December, 487 eggs @ 80c per dozen; \$21.00 net profit. January, 428 eggs @ 78c per dozen; \$20.00 net profit. Have decided that you breed the kind of stock I want.

Yours sincerely, L. H. Cross.

White, Buff and Brown Leghorns, White and Barred Rocks, White Wyandottes, R. I. Reds, Anconas, Black Minorcas; Pekins and Indian Runner ducklings.

RANSOMVILLE, N. Y.

stuff, a well-balanced grain ration scattered in deep litter and keep the chicken house free from drafts. "The little Red hen" will work, sing and lay all winter when the smaller and lighter-weight breeds are spending their time trying to keep warm.

Docility. The Rhode Island Reds are not the wild, roaming type of fowl, but rather of a contented disposition. While, the lighter weight fowl is restless and likes nothing better than to fly over a neighbor's fence and wander at will through his carefully tended garden, thus precipitating the owner into very unpleasant relations with the said neighbor, the Rhode Island Red seldom ventures to scale even a medium fence and stays contentedly at home in her own yard. They can be accustomed to being handled very readily, which is especially important if the owner wishes to show them at the various fairs or poultry shows.

Size. We have found that the very heavy breeds, such as Orpingtons, Buff Rocks, etc., are apt to become inactive and as a result put on fat and lay less eggs as they grow older and as warm weather comes on. They become broody quite frequently, especially in warmer weather. The Reds being a medium weight fowl are not thus inclined and are noted rustlers. They make excellent mothers, however, when desired for that purpose, but we find that they will seldom become broody if kept in good laying condition. The very heavy breeds often mash the eggs in the nest, also the young chicks, and hence are not desirable as setters. The Reds are not apt to have this fault, and will set faithfully, generally bringing off a good hatch if given a fair opportunity other conditions being favorable. The chicks reach maturity quickly and can be marketed as friers at a good price if one desires to cull early and thus decrease the size of the flock. The smaller breeds are either non-setters or are not dependable as setters, while the friers cannot compare with the Reds in flavor or price received for them in market.

Commercial value. I know of no other breed that will bring a better price for breeding stock, hatching eggs, or eggs for market. The person who has carefully selected his

First prize White Orpington cock at Indianapolis, Ind., 1922. Owned by Wm. N. Otto, 5425 College Ave., Indianapolis, Ind.

foundation stock and has kept them consistently culled each year, keeping in mind Standard type and color as well as egg production will have no trouble in selling breeding stock or hatching eggs at a good price. If one wishes to keep only a small flock for his own use, he will find that the Reds are a good fowl for that purpose, and if properly cared for, will pay. He may have excellent meat for his own table, fresh eggs at all seasons of the year and nice, large ones at that, and if he has any surplus stock or eggs to dispose of at any time he will always have a product which he can recommend. If he wishes to prove more interesting and fascinating than the Reds, and here again the financial standpoint will be an object, for what breed can we find that has more admirers and will bring a better price than the Standardbred Rhode Island Red exhibition fowl? It is the one breed where beauty and utility are combined to perfection.

Oregon. Mrs. Vera Mead.

Experience of a Beginner.

Last year was the first attempt at poultry raising on "my own hook." I started in with only \$20 cash, bought \$85 worth of chickens, paid \$20 down and have made the other payments in small sums until I have only \$11.92 yet to pay. I started with only one breed, the S. C. Rhode Island Reds, and have since added the S. C. White Leghorns to my flocks.

I have learned that the hens enjoy and appreciate clean quarters and pay returns for kindly treatment. I enjoy working about the Reds because they are gentle, docile, and easily satisfied. They do not require near so much time or attention as the Whites, but the Whites are much better layers and if not treated right by the owner, will look out for themselves. They are contented if allowed to select their own nests and their own places, but will not stay "put." Though they give me lots of trouble, I admire their hustling disposition and independence. They do not

Prize winning S. C. White Leghorn male. Owned by Albert V. Wheeler, Route 1, Box A, Carlinville, Ill.

HATCHING EGGS

For the season of 1922, I have mated up 20 wonderful matings from which I am pleased to share eggs with those seeking the best in Barred Rocks. In the past, my matings have produced birds which have swept the decks at the very largest shows in the country, my latest win being every prize but third cock bird and fifth hen in the strongest quality class of the season, Washington, D. C., Thanksgiving Week. And what is of still more interest to you, they also produce winners for my customers.

Dunnellen, N. J.

Dear Sir:
From the setting of eggs, I purchased from you last Spring, I had four cockerels; one of them won first and color special at the New Jersey State Show being held in Newark this week. C. C. Dunham.

Prices of hatching eggs \$15 per 15; \$28 per 30; \$40 per 50 and \$80 per 100. Circular free. Complete line of stock for sale at prices you will gladly pay.

NEWTON COSH

Box A Vineland, N. J.

wait to be fed but "go for it" themselves.

Right here, let me state that the feeding proposition is about the biggest that I have to contend with. Though I have been at the business over a year now I do not know when I have fed enough, and when not enough. I have learned something of that, but very little.

I have suffered some losses on account of rats, bugs, and lice, and some during a rain, but what birds I have left are fairly healthy and in good condition. The chickens that I started with were not near up to Standard but I have culled and sold until I have something like about the average of purebred chickens, and the few that I raised this year are better than what I started with. With another year's care and attention and by the introduction of some more Standardbred stock of higher quality than my own, I hope to be above the average in another year.

One of my hens is singing and strutting about now as I write this article, and though she is out of her place and on forbidden territory to hens, the yard, her song sounds good to me and I shall be glad to get the egg, so I guess I should not complain. I do wish, however, she would stay home a little better.

I enjoy the work here but it is sometimes rather lonely with no one about except early in the morning and at meal time, but studying chickens is so much enjoyment that I have not much time to be lonesome when there is something to do.

As I look about at the improvements that need to be made I realize that I haven't money enough to even think about many of the improvements that I would like to make before winter sets in. But I have taken in something over fifty dollars during the past year, so by the second year I hope to have more improvements, for by that time I will have made the last payment on the chickens, and henceforth the proceeds will go for something beside paying for the investment.

During the year I have killed numbers of rats, bugs, one polecat with the help of a brother, and helped another brother kill an opossum, and helped a neighbor save about twenty-four or five of her baby chicks. Here is how we saved the baby chicks. I was visiting in a home of a neighbor during harvesting time and a shower came up. Suddenly looking out the window I saw the baby chicks drowning, so my sister ran out and brought them in and she and the neighbor and myself heated the oven and dried them good, then fed them some warm yolks of eggs, and they lived, though they were almost drowned when sister got them.

I have sold three cocks, one cockerel and several old hens and some fryers during the year and still have two good cockerels among the White Leghorns and four good pullets among the Reds. I entered the fourth National egg laying contest and won the highest hen for June with a record of 26 eggs. Is that bad for a beginner?

Mary A. McClellan.

A Beginner's Experience

Five years ago I launched out in the poultry business. I began with 25 hens and talk about Jacob's coat of many colors. It had nothing on those hens.

I petted and pampered and coaxed and plead with those hens to lay eggs when eggs were high, but alas! they heeded not.

My feed bills piled up, but not the eggs. When I fed them and cared for them about four months without results I saw that I could not afford to keep hens that would not lay.

We had homesteaded 40 acres of mountain land for the purpose of converting it into a poultry ranch. And starting into the poultry business, or any other business for that matter, without any capital is an uphill piece of business.

But I believe the poultry industry requires the least capital of any animal industry I know of, provided one is satisfied to start in a small way and work their way up, which, to my notion, is the best way, for one gets experience. I do not believe that anything but actual experience will teach one to properly care for poultry. We may read poultry journals and other people's experiences and gather many ideas that are useful, but no one knows the steps and methods

Wiped Out Every Rat and Mouse

**G. H. Williamson, A Country Merchant,
Tells How He Saved Hundreds
Of Dollars**

"There isn't a rat or mouse in the store since I put out Imperial Rat Virus. It certainly does the work. It is so simple and inexpensive that I tell my neighbors there is no excuse for being bothered any longer by these pests. I wiped them out of my store easily and quickly."

Mr. Williamson goes on to say that he had given up in despair, after being incessantly bothered by these pests in the past, and having tried every known rat poison and appliance for the destruction of rats and mice. They only seemed to increase in numbers and were literally over-running his premises, when, one day Imperial Rat Virus was called to his attention, he decided that one more dollar should go into the purchase of something that offered a promise to solve the problem. "I want to tell you I was surprised and delighted with the work accomplished by this simple method," writes Mr. Williamson. "You can take my word for it, I have not seen a rat or mouse in my store since I put out Imperial Rat Virus."

Easy To Get Every One

IMPERIAL RAT VIRUS is the new discovery used by Mr. Williamson. It is not a poison and is absolutely harmless to humans, domestic animals, poultry, stock and household pets. It can be used anywhere with absolute safety. It is deadly only to rats, mice, gophers, ground squirrels, or any member of the rodent family. It is greedily eaten by them on bait, and sets up a burning fever, giving them a fatal disease which is transmitted to others through their cannibalistic habits; thus the entire colony—root and branch—is soon exterminated. They die outside of the buildings, hunting air and water.

You Can Get Yours Free

You are invited to write today, as Mr. Williamson did, to the Imperial Laboratories, who are making a special Introductory Offer of two big regular, full-sized "double strength" \$1.00 bottles for the price of one. Use one bottle to rid your own premises of these pests, and sell the other to a neighbor, thus getting yours free. Send only \$1.00 (currency, money order or check) and the two full-sized bottles of Imperial Rat Virus will be sent you postpaid.

If more convenient, do not send any money, just your name and address, to the Imperial Laboratories, Dept. 802, 2110 Grand Ave., Kansas City, Mo., and pay the postman \$1.00 and a few cents postage when the package arrives. It costs nothing if it does not do the work. The Imperial Laboratories positively guarantee to refund your \$1.00 within thirty days, if you are not satisfied with results.

A Practical Brooder, \$4.96

Your dealer will sell you a Putnam Brooder Heater for \$4.75 and supply FREE plans for making a practical brooder at a total cost of less than \$5, including heater. Such a home-made brooder will care for from 35 to 60 chicks with less work than any other brooder. The heater requires filling only once in 10 days. Cannot blow out, will not tip over. Read full description on page 520.

that are best for them individually until they learn for themselves.

When February came and I had only one or two hens laying I sat down to think. I was paying out good money for feed, and money to us just then was hard to get. So I looked the matter square in the face and decided thoroughbred poultry was what payed. I had been reading poultry items, and had studied different breeds so decided the egg type should be mine.

I gathered up my mongrels and went to market. I had heard of a bunch of White Leghorns for sale and thought I would buy a dozen of them, but when the man saw I really meant business he raised the price so I did not buy them.

I heard of a bunch of Anconas, and as I had read a little about them, decided to look them over.

I fell in love with them at first sight. Their red combs and bright eyes gave them such a business look and their black plumage with the white specks appealed to my artistic taste. Altogether, "I was carried away with them."

It was a cold, snowy, blustery day, but those little hens were just "cackling to beat the band," and best of all, there were a lot of big white eggs in the nest. I was so well pleased I bought them right on the spot.

I gave \$22 for 20 pullets and two cockerels and one of those cockerels was the finest looking bird I ever saw. He certainly was a good advertisement for the variety.

I have always thought that trading those mongrels for thoroughbreds was the best trade I have ever made. I have never regretted my choice of fowls, and today I would not exchange them for any breed of chickens I ever saw. They laid eight eggs the day after I got them, and just kept on. I have never had any trouble getting winter eggs since then. I went to studying poultry journals and up-to-date methods of handling poultry and I have much to thank the A. P. J. for.

I decided to line breed, but about the middle of the summer my fine cockerel got a oat beard fastened in his throat and I lost him. Then I lost several hens with the roup, caused from a leaky, drafty chicken house, so altogether my first experiment with thoroughbred poultry was unpromising; however, I managed to raise another nice cockerel and bred him back to the hens; and in this way I laid the foundation for future line breeding.

From the 1st of November till the 22nd of February, last year, 20 pullets have laid 1,048 eggs, and they have had very poor quarters, as the house is dark and damp and the sun never gets to shine in it more than an hour a day. But these hens are layers. I have learned to cull the slackers and will only breed from winter layers, for I believe this is the only way to establish a laying strain.

Here is the method I use. I breed my pullets back to the father, and the mothers to their cockerels. Always selecting a vigorous and as near to the Standard bird as I can. In this way I have a flock I am proud of and one that pays.

My method of feeding is this: I feed a commercial scratch feed which is composed of corn, wheat, oats, kafir, buckwheat and some sunflowers; a pint of this in the morning is thrown in a litter of straw six or seven inches deep. In a self feeder (which I made) I keep shorts and bran before them all the time

Light and Dark Brown LEGHORNS

Buy some of my choice Single Comb Brown Leghorn eggs for hatching and raise some winners and layers. Price of eggs from mated yards are \$2.00 to \$10.00 for 15, and from range flock \$1.50 for 15, and \$8.00 for 100. My strain originated mostly from Tur-mohiens and Grove Hill's best birds and are surely fine. Baby chicks for sale also. John W. Moore, R. F. D. No. 1, Dept. M., Poplar Bluff, Mo.

BANTAMS America's favorite. 40 varieties. Game and Ornamental. Shipped on approval. Winners at the largest shows. Stock for sale. Prices reasonable. Cat. 2c. Also choice Pheasants, Yokohamas, Peafowls, and Pit Games.
F. C. WILBERT & CO. Grand Rapids, Mich.

and at 2 o'clock or in the early afternoon I feed a mash composed of table scraps, vegetable sor anything I happen to have handy, moistened with milk. Enough bran and shorts is stirred in to make it crumbly, but not sticky.

At night I feed whole corn, as it takes it longer to digest and makes the heat to keep them warm. My idea for feeding such a small amount in the morning is to make them work, as the busy hen is the laying hen. I keep either buttermilk or clabber milk before them all the time; also a box of lime, charcoal and ashes for them to eat and dust in.

Our chickens here do not have to be fed grit or oyster shells only when confined, as they get all required when running out.

To the man or woman that is willing to work with mind and body, too, and who is not too easily discouraged, let me say there is something in the poultry business for him. But it takes patience and work to make poultry a success; also it takes study. It sounds easy on paper, but experience is the teacher. And unless one loves chickens for what they really are and studies them individually, and has a Standard to work to, he will not accomplish much.

The best plan I could suggest is to decide on what breed you want, then get the very best you can afford to buy of thoroughbred fowls and fix your ideal on eggs, meat, or feather, or all three combined, and work to that goal. In this way you can breed chickens that other people will want and in which you will take a pride.

Arkansas.

Mrs. Miles Call.

Make the House Comfortable.

A considerable number of farm flock owners have been so impressed with the possibilities from poultry under proper management that they have built new poultry houses of modern design. On many other farms poultry houses that had been in use previously have been considerably remodeled so that the birds are given more room and better arrangement is provided for light and ventilation. On still other farms poultry houses yet remain in use that are entirely unsatisfactory from the standpoint of the hen; and a striking fact about the records is that production on the farms having poor housing conditions is almost uniformly much poorer than from the flocks that have comfortable quarters.

There is small excuse for the housing conditions still found on some demonstration farms. A number of flocks visited recently have been kept in buildings that had practically no sunlight and very little provision for the admission of fresh air, while even a larger number have been found that were not supplied with droppings boards. Each flock owner who has any personal interest in his birds should see that the poultry house is well enough lighted by the aid of a sufficient number of windows properly placed so that the birds can see to pick up feed in the litter at any hour of the day in all corners of the house. About one square foot of windows should be provided for each 15 square feet of floor, and these windows should be so distributed that both morning and afternoon light will be admitted as well as arranging to have sunlight during the middle of the day.

Even more important than light from the standpoint of the birds is a provision for liberal quantities of fresh air without subjecting the birds to draft. This is usually provided by leaving a part of the south side of the poultry house open and making the other three sides as neraly air-tight as possible. An especially poorly ventilated type of house much too commonly found is one where a narrow shed has been improved by building a scratching shed on the south side, and then instead of taking out the original south wall and making the house into one large comfortable building, the tight south wall has been left so that the birds are forced to roost in dark, damp unsanitary quarters that have practically no ventilation. In cases of this kind, the chief thing that is necessary is to take out the partition between the scratching shed and the roosting quarters and make all of this available for scratching space by providing a dropping platform underneath the roosts to keep the droppings off the floor.

A considerable number of poultry houses are built so high that the amount of air space that must be warmed by the birds is so great that it is impossible for winter temperatures to be pleasant. This can be remedied by putting in a straw loft to occupy all the excess space in the top of the house not needed as head room by the caretaker.

In providing ventilation enough space should be left open in the south side of the building so that the open front will equal one-tenth of the total floor space. This open screen ought to be near the bottom of the south side rather than at the top so that the warm air from the roosts will not flow up and out of the open space.—T. S. Townsley.

Raising the Chicks.

By Otto E. Hackman.

Chick raising is an interesting undertaking, if properly done, but to some it is a disappointing and discouraging operation. The latter should not be the case, however. If the chicks are properly hatched in the first place there really should be little difficulty experienced in raising them successfully to maturity. No one, not even those who have had years of experience, can raise successfully to maturity the chicks that are brought into the world in a weak, sickly condition. The first two weeks after hatching has always been considered the most critical period—when the highest per cent of mortality takes place—and it is, in fact. So, if we can bring the chicks, or the greatest per cent of them, successfully through this period, we may very properly consider our worst troubles over.

It is perhaps needless to state, as it has been iterated time and again, that the chicks for the first forty-eight hours require no food at all, and that it is unwise to provide any. However, for the benefit of the beginners, who, by the way, are always with us, wish to state that it is not only unwise but a dangerous practice to offer the chicks food at this time. Nature, in the process of the absorption of the yolk of the egg into the abdomen, has

New Way of Hatching Makes More Money!

In less than 4 months, Mrs. C. A. Saunders, Center, Neb., made over \$120 with a small Porter Soft-Heat Incubator and had 150 chicks left. At present prices her return would equal \$50.00 a month. Or, with the largest Porter, \$75.00 or better. Hundreds of Soft-Heat users tell of big profits. You, too, can make easy money with a

Porter SOFT-HEAT Incubator

Hatches a big, strong chick from every good egg by supplying life-giving moisture, as well as warmth. Keeps shells brittle and membranes tender so chicks break out easily—no suffocation, no cripples.

Tubeless—Automatic Cumbersome unsatisfactory tubes and pipes done away with by patented full radiator plate. Heat, moisture and ventilation automatically controlled—always even—need no attention even in coldest weather.

Center Heat—Round

Egg Chamber

Side lamp eliminated, saving space and weight. Radiation from above in round egg chamber, like hen's nest, heats every egg evenly.

Saves 300% Intime, money and labor, less than 1 gal. of oil—costing less to hatch. Others burn 4 to 5 gallons.

2 Minutes Daily Is all that a Soft-Heat requires. Eggs turned semi-automatically, without removing or lifting tray. Children get same good results as experts with Soft-Heat.

Free Book

Illustrated. Tells reasons for amazing success of Soft-Heat, gives users' testimony, shows how you can make money with a Porter. Send post card for free copy TODAY.

PORTER INCUBATOR CO., BLAIR, - NEBR.

Is She Laying Or Not?

A—Who has large fingers says "No."
B—Who has small fingers says "Yes."
C—Who has medium fingers says "Doubtful."

What is to be done when "Doctors" disagree? Every hen has certain pronounced characteristics which determine her laying condition and capacity for large or small production. How to tell these signs with accuracy is uncertain if not impractical by the well known and so-called "finger method." While all authorities agree on the principle of this method of testing, many poultry keepers do not secure the same results from the same hen. The theory is correct, but the method is uncertain.

Albert Angell, Jr.,—the poultry expert of The Quaker Oats Company, address Chicago, Ill., has made a thorough test of the finger method of determining the good layers from the bad—covering a long period of time in which hundreds of known producers and non-producers were used and tested by many different size fingers of as many people. Mr. Angell, as the result of this experiment, has invented and perfected an instrument which he calls "The Angell Hen Tester"—and is now offering it for sale by The Quaker Oats Company, Poultry Feed Dept., address, Chicago, Ill., as a means of culling with certainty.

The Quaker Oats Company has also just published a book by Mr. Angell in which the story is explained in detail. The name of this great book is "How to Know Profit From Loss." It is sent postpaid with "The Angell Hen Tester" for \$1.50, and will be worth many dollars to every poultry keeper.—Advertisement.

American Fur Breeder, Box 229, Eminence, N. Y.

provided for the chicks' bodily nourishment the first two days and it is the height of folly for man to try to improve on the works of nature. The chicks would even perhaps do better with total abstinence of food for perhaps twelve hours longer.

It is always best to confine the chicks close to the mother hen, when reared by the hen, as rest and quiet is more beneficial at this time than anything else. They are gaining strength and deriving the necessary brooding, which is so essential to proper development later. In about two days or so after hatching the chicks will begin to show considerable activity and an inclination to run about and pick up such small particles of food or grains of sand that may chance to lie around. It is then the proper time to commence giving them food. The first meals, however, should be something easy of assimilation and very nourishing.

Feeding the Chicks

Most breeders have their own pet method of starting the chicks off and perhaps each derive the same results, although in a different way. I cling to the stale bread and milk method of feeding for the first three or four days. I find it starts the chicks off nicely and there is no bowel trouble. Stale bread is broken up and mixed with the milk and squeezed practically dry. This is fed on a clean board or in a dish and my aim is to give not more than they are capable of eating. When any remains uneaten it is removed to prevent soiling, souring and contamination. "Little and often" is the rule and the chicks are given five feeds a day during this time, the first meal as early in the day as possible, and the last feed of the day as late as possible. If the last feed can be given late in the evening, after dusk, by the use of light, it is a great advantage, as this would help in doing away with the long period between feeds during the night, and would hasten development.

After the three or four day period of bread and milk feeding, the chicks may be started on a part grain ration. Fine cracked grains, or what is still better, "pinhead" oatmeal, is fed about three times a day and the soft feed twice a day. I prefer to feed the oatmeal in preference to mixed cracked grains for the first ten days as this is a wholesome and nourishing food, and is eaten up clean with no waste. Of course, it is a trifle higher in price than the mixed grains, but the good start the chicks get more than counterbalances the difference in price. We should consider the development of the chicks rather than the slight increase in the price of the food during this period. Hard boiled eggs—infertiles tested out of the incubator hatch—can be used to good advantage in feeding the chicks, and with fine results. The eggs are crumbled up, shells and all, and given to the chicks either alone or mixed with stale bread crumbs or rolled oats. The number of feedings per day are gradually cut down until the chicks are getting but three feeds a day.

It is advisable to cover the floor where the chicks eat with a half inch of fine chaff or sweepings from the

The DETROIT Ready to Use

hay loft. The floor should first be covered with a half inch of black loam, and then the chaff scattered thereon. The chaff is to induce the chicks to scratch for the grains scattered therein and thus derive the much needed exercise. The feeding of the bread and milk, after the ten day period, is followed by the feeding of a chick mash. This may be fed either wet or dry, but I find that feeding it both wet and dry, fine results are derived. In my opinion, one meal a day of moist mash promotes additional growth. The buttermilk mash has my preference, and I find that with its use there is no bowel trouble to contend with, the bane of so many beginners. A little bone meal added to the mash produces excellent results in development.

Keep the chicks well supplied with water, but be sure it is pure water. Keep the water vessels clean. Frequent scaldings will keep them clean and sweet. Have the vessels so arranged so that the chicks cannot get into them with their feet. This not only contaminates the water, but also gets the chicks wet, which most always results in chilling, and chilling is a forerunner of bowel trouble.

Brooding the Chicks

Early chicks are necessarily confined indoors and must therefore be supplied with green food. Raw onions, chopped fine, are usually relished, and produce excellent results. Raw potatoes, also, are fine. They should be cut in half and thrown to the chicks for them to pick at. Sprouted oats is perhaps the better method and the easiest of providing a good source of green feed.

When the chicks are reared in a brooder, avoid the mistake of overcrowding them. They may apparently be plenty of room when the chicks are just hatched, but we must remember that they grow rapidly and will soon be badly handicapped for lack of room. A brooder rated at fifty chick capacity should really have only half this number. In fact, it is never advisable to keep more than twenty-five chicks together in one brood, unless one is using a coal heater and a brooder house. Too much room never does harm, but lack of room always works harm. The brooder should be well ventilated, but without drafts. There should be no inaccessible or hard to clean corners in the brooder. It should be opened up often to permit the sun to shine in, as this purifies it. The corners should be rounded so as not to permit the chicks crowding in the corners, which results in smothered and dead chicks. Heavy cardboard should be tacked across the corners in a semi circular form to round them off.

The temperature of the brooder should be neither too warm nor too cold. The best way to gauge the right temperature is to watch the chicks' actions. If they crowd together and huddle up they are too cold. On the other hand, if they strive to get as far away from the source of heat as possible and pant, they are too warm. If they arrange themselves along the edge of the hover chamber where the curtain hangs, with their heads peeping out

Metal Mother Brooder & Hatcher

\$11 This shows the Cycle Brooder-Hatcher with a part of the front cut away to show the interior arrangement.

A 50-egg incubator and brooder combined, one lamp serving both purposes. Hatches more and better chicks at lowest cost. Simple, durable, all metal construction. Round like a hen's nest, closely duplicates natural hatching principles, perfectly uniform heat supplied to all eggs, long-burning safety lamp, accurate automatic regulator.

Weights only 20 lbs. packed for shipment. Price \$11.00. 50-egg Cycle Hatcher, without brooder, \$9.00.

Our catalog tells why you can hatch better chicks and more of them with a CYCLE. Write today for free copy, or order direct from this advertisement for immediate shipment—no delay.

PRONTO POULTRY PRODUCTS CO., 62 State St., Rochester, N. Y.

and seem contented, we may rest assured the temperature is all right.

As the chicks get older and attain size, coarser and less expensive grains are substituted for the finer and more expensive grains. And the regular laying mash is used in place of the chick mash. And remember, to get those big, husky, big boned layers, winners, and payers we must feed them—give them all they want. Don't play both ends against the middle by cutting down the rations in an endeavor to cut down expenses. This would defeat the very object we are striving to attain. And nothing is more certain to make the stock pay than to feed the growing birds well—so the proper development is obtained.

A Poultry Breeding Program.

[Stenographic report of lecture by Prof. George W. Hervey, Madison Square Garden, January 27, 1922. Professor Hervey, of New Jersey Agricultural College, helped to drill the students who won the silver cup in the Intercollegiate Judging Contest at the Garden Show.]

Ladies and Gentlemen: The audience this afternoon is, I presume, a mixed one. Some of you are breeders of exhibition birds; others, no doubt, have never given a thought to exhibition points. Perhaps you have a flock of birds that are laying eggs and returning a fair income. Some of you have never considered such matters as squirrel tails, wry tails, crooked backs, deformed beaks, side sprigs and the other major points that the exhibitors in the arena upstairs have been studying for years. A trip up and down the aisles, observing the specimens and talking with the exhibitors, should be worth dollars even to those who are in the business on a small scale. Some practical points on improving the breeding stock may be secured. Remember that first improvement comes in the use of good breeders. This in turn results in a uniform flock and a uniform flock means a more uniform product, whether it is eggs, baby chicks, dressed poultry or breeding stock that may be offered for sale.

At this time I am reminded of the simile of the triangle which Professor W. R. Graham, of the Ontario Agricultural College, used in a lecture during Farmers' Week at the University of Missouri a few years ago. Prof. Graham stated that successful breeding operations may be compared to the three sides of a triangle. On one side is the man, on the second side are the birds and on the third side is the environment in which the birds live. If the man is not interested in his birds and does not take regular care of them, no matter how good the environment and the birds themselves may be, a good profit cannot be secured. If the environment and the man are of the very best type successful breeding operations cannot be carried on without good birds in the flock.

The initial step in breeding a flock of good birds is the purchase of a copy of the American Standard of Perfection, which is a book published every five years by the American Poultry Association. This book may

SILVER CAMPINES

GREEN SHEEN STRAIN

Again Champions at the Great Chicago Coliseum Show
Dec. 6 to 11, 1921, where I won

Cock	Hens	Cockerels	Pullets	Old Pen	Young Pen
3	2	2 3	2 3	1	1

My birds were the admiration of many judges and breeders, and were recognized as superior to all former exhibits. This is the tenth consecutive time that my birds have been the champions of the great Chicago show. Breeding pens now mated. Mating list ready for mailing. My birds are single mated and exhibition birds are mated together. No trick back of these birds.

Campines are fast growers, plump at all ages, heavy layers of large, white shelled eggs and eat less than Leghorns.

I have the largest plant devoted to the raising of exhibition and high record Silver Campines in the United States. My birds have been linebred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 69 males placed under ribbons at the Coliseum Show in last ten years. During the same period, I have had 160 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history.

Write me for information. Your absolute satisfaction is guaranteed.

be secured from the Secretary, Mrs.
E. B. Campbell, Fort Wayne, Indiana,
or from any of the poultry journals.
If one is breeding White Wyandottes,
I do not believe he can breed his
stock to a high degree of efficiency
without learning about some of the
outstanding exhibition points of the
breed. This applies to the White Leg-
horn breeders, Rhode Island Red
breeders, in short, all of the breeders
of standard varieties. It is absolutely
impossible to appreciate the good and
the bad points of a fowl without know-
ing the Standard to which the men
who are most successful in the busi-
ness and breeding their birds.

The exhibitors in the Garden are
breeding their birds according to the
Standard of Perfection, and if it is
good enough for them, it surely is
good enough for the smaller breeder
who must copy their practices in or-
der to make a success of a poultry
venture. By this I do not mean that
the man who is engaged in a utility
egg business must become a fancier.
It is not necessary that his birds score
high from an exhibition standpoint, but
the outstanding defects of each breed
as enumerated in the Standard of Per-
fection should be eliminated from
every flock, whether it be a commer-
cial egg producing flock or merely a
farm flock where a continuous sup-
ply of fresh eggs is of first impor-
tance.

A knowledge of the Standard points
of the breed one is keeping is an in-
itial requirement for successful breed-
ing. After one has established a uni-
form flock on his place, he must then
turn to the practical points of breed-
ing. It must be borne in mind, how-
ever, that poultry breeding is very
complicated and that each improve-
ment must come gradually, step by
step, because of the established fact
that it is very difficult to breed for
more than one character at a time.
After the man is satisfied that his
flock is all right from the standpoint
of freedom from breeding defects in
the appearance, he may then turn his
attention to other practical breeding
problems.

The utility man today should be
concerned more than he is with trap-
nesting. We read startling advertise-
ments of 200 egg strains of poultry.
Those of you who have been in the
business a great many years know
that it is a very remarkable breeder,
indeed, who is able to secure a 200
flock average. What right has the
individual to advertise a production
of a given number of eggs unless he
is able to back up his claims by au-
thentic trapnest records? I do not
believe that it is a practical thing
many times for the breeder to trap-
nest his whole flock. If one is keep-
ing about 200 layers it is logical for
him to trapnest about 50 in his flock.
Of this number maybe about a dozen
will return an exceptionally high egg
record for the year. Those birds
might be kept over a second year for
use in a special breeding pen. Those
specially selected hens should be mat-
ed to the very best male bird obtain-
able, preferably one that has come
from a high layer, but whether the
bird comes from a high egg layer or
not, he should be inspected very close-
ly to see that he carries no general

disqualifications as outlined in the Standard of Perfection.

It is not necessary for the breeder to send away year after year for new cockerels to introduce new blood lines into his flock. He might use the male bird that he has purchased a second year, and possibly a third year, although he will find that the fertility of the eggs will not be so good after the cockerel year. In some cases this bird might be inbred on his daughters. A breeding pen the third year, therefore, might contain not only the females that have returned high records during the first year's trapnesting, but also their daughters, birds that have returned a satisfactory egg yield during the second year. In subsequent years the sons of the initial male bird might be used. In other words, line breeding is entirely logical, provided there is no marked defect in any of the breeding birds concerned. If at any time some defect like a narrow back, or a pinched up head appears, it is a good idea to introduce a male bird from some outside source, purchased from a reliable breeder, to correct the defect, but under ordinary circumstances out-crossing should not be resorted to except in rare instance, certainly not more than once in four or five years. Hens that have returned a high egg record under the trapnest, mated with cockerels of known pedigree, therefore, should constitute the breeding pen.

I have just mentioned the subject of trapnesting. I must admit that all are not equipped to practice it. The culling that you have heard explained several times this week is, I believe, a fair substitute for the trapnest. It is not absolutely perfect. The culling is about 90 per cent perfect. It should be practiced whether the trapnest is used or not. Furthermore, it should be systematic. Too many times the poultryman culls his flock just once or twice during the culling season, thinking that he is selecting very rigidly.

The culling proper should commence about the 1st of July each year, and continue until the 1st of November. It should be done every two weeks, eliminating the non-producers as fast as they stop laying. If one practices a regular plan like this, when the 1st of November comes he will have culled out, under ordinary circumstances, at least half of his flock, preferably more than half. It is this reduced number of birds, the ones that have maintained a satisfactory production into the late summer, that should be held over for the next year's breeding operations. Birds that have been culled out are replaced by March and April hatched pullets when the birds are placed in winter laying quarters the latter part of October.

Just a word or two about the environment. Very often people write to the Experiment Station stating that they are feeding the rations that we are recommending and are not securing eggs. We write back something to this effect. "Are you keeping your birds confined from the 1st of November to the 1st of April? Are you allowing them to run out of the houses and get their feet cold? If you are doing that you cannot expect to secure eggs. Are you feeding against exposure? Do your birds have lice? Remember, a hen that carries vermin of any kind cannot be expected to give a satisfactory egg yield. Are your birds infected with intestinal worms?"

JOHN L. BROWN

65 Indiana Ave.

ANDERSON, IND.

A positive answer to any or all of these questions may explain an inferior production. The poultry business is a series of complicated problems of management.

There is a fair outlook in the business. I do not believe that such good profits may be expected in the next few years as we have had in the past, but, under proper management, a purebred flock of poultry will return a satisfactory income on the investment, say, six, seven, eight or nine per cent.

Check your egg production against this table that I am about to read:

November	8 eggs
December	10 eggs
January	10 eggs
February	12 eggs
March	19 eggs
April	21 eggs
May	20 eggs
June	18 eggs
July	16 eggs
August	13 eggs
September	7 eggs
October	6 eggs

This table is based on a flock production of 160 eggs per year. This, to my mind, represents an ideal toward which the small breeder may work. During the first year such good production may not be secured, but after a year or two of good constructive breeding, there is no reason why as good production as that obtained in the various egg-laying contests of the country where the feeding points and rearing practices—in other words, good environmental conditions, are correct, although simplicity in themselves.

Provide a good environment.

Rid the flock of vermin.

Own good quality stock.

Feed rations that are balanced for egg production.

Improve the stock by constant selection.

Take time to keep a few records.

Line Breeding.

Dear Editor: I have been a subscriber to your most highly valued journal for a number of years, and have found most of the articles therein very instructive and inspiring to the poultryman—it making no difference to what extent he is engaged in the business or which particular phase he is interested in.

However, we occasionally read something that does not set very well—in other words, it rubs our "feathers" the wrong way.

A particular article of this kind is the one in the February number written by A. F. Rolf, in which he attempts to ridicule all those who claim to practice linebreeding.

I am not personally acquainted with Mr. Rolf, therefore do not know whether he is a breeder or not, but I can not imagine him to be a successful one if he does not practice line breeding to some extent.

It has been stated time and time again through the columns of your journal by able writers, including yourself, that the only way to establish a strain was through line breeding and that is the method that has placed poultry on the high plane of excellence that it is today.

It is true that there are a great many breeders of poultry that claim to line breed that have no idea of what it really means, just as there are those that claim to trap-nest their birds who have never had a trap-nest on the place.

But we know it to be a fact that there are hundreds right here in the Pacific Northwest who trap-nest the year round from 200 to 2000 layers each, just as we know there are hundreds that line breed their birds along some definite plan.

In my own case I have bred White Wyandottes for 16 years, and 11 years of that time did not introduce any new blood. I have won the blue ribbons at the best shows in this section under the best Mid-west and eastern judges and have a strain that is noted for standard type and early maturity—pullets laying as early as 5 months of age.

I note that Mr. Rolf is Secretary of the White Leghorn Club, but that does not necessarily mean that he is a breeder, or for that matter a chicken "raiser," but if he were a breeder and had rigidly followed line breed-

ing with careful selection of the best specimens as to type, color, size and vigor the results would have been so gratifying that he would not have relieved himself of so much hot air in writing the article in question.

Oregon J. A. Griffin.

R. I. WHITES AND CHANTICLEERS

I am just in receipt of the February number of the Journal, and after reading the three letters under caption of "Question of Admitting Rhode Island Whites," I cannot refrain from giving my opinion on the subject.

Now, I approve of the American Poultry Association refusing admission of the Rhode Island Whites to the Standard of Perfection, for the time being. The reason is not because they are practically identical to the White Plymouth Rocks or the White Wyandottes or what not, as most every one will lead you to think, or because of prejudice against the breed. No, the American Poultry Association is a pretty good old institution which has done tremendous good for the poultry world, and it still right at the top plugging ahead for the best interests of every breeder and poultryman. It is responsible for what the industry is today, is above such things as prejudice, and cannot be coerced into admitting to its Standard something that has no real value.

The real reason for its refusal to admit the Rhode Island Whites to the Standard of Perfection is that at the present time there is no such thing as a Rhode Island White, as a breed, and this, to my estimation, alone is reason enough. When Messrs. Breeders of so-called R. I. Whites have designed and adopted a Standard for their breed, and after years of careful breeding, culling and eliminating, they have produced birds that come up to the Standard and can reproduce Standard quality, then and only then should the A. P. A. admit the breed to the Standard of Perfection; and its action will then have the endorsement of every breeder. But as long as they keep on trying to secure admission to the Standard, but neglect the breed and keep packing the show-rooms with birds inconsistent in type; as long as they go about and shout that "for the past two years I have been using White Wyandotte males to head my breeding pens," as was done by one prominent Rhode Island breeder during the last Boston show, or exhibit White Rock culs for S. C. Rhode Island Whites, so long will the breed be justly refused admission.

Above I stated that there was no such thing as a R. I. White, and anybody visiting the great Boston show will tell you the same. There was a flood of birds entered as S. C. and R. C. Rhode Island Whites and honestly it was a shame to admit under the same roof, such abnormal birds with as fine specimens of Standard birds as first White Wyandotte cock, which could win anywhere in the world, or first Dark Brahma cock and hen, which were exceptional, or again first White Rock cockerel, which was to my estimation the outstanding bird in that great show, even though comb was a little frost bitten.

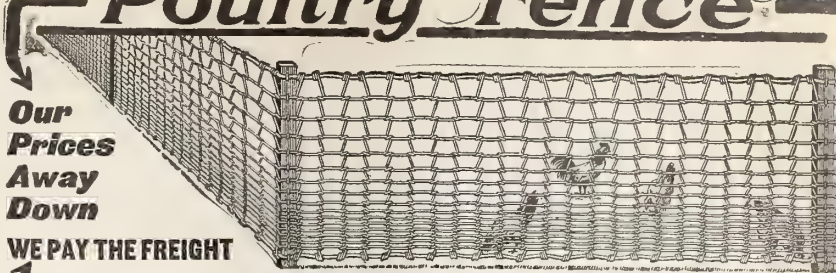

If the owners of S. C. and R. C. R. I. Whites had not tacked labels on the coops, with their names and name of the breed, one could not have told to what particular breed they belonged. Oversized, undersized, some Rock types, some Wyandotte types and some of no particular type. And the combs, terrible! Some S. C. birds had to live and support combs the size of old-fashioned pancakes; others a diminutive single comb hardly perceptible. In the R. C. variety some boasted of combs which I would class as a cross between a La Fleche spike and an Ancona's single comb, with a lop-sided V-comb as result. No, how in the name of common sense can the A. P. A. be expected to recognize such abnormalities?

It takes more than big financial backing to be admitted to the Standard of Perfection, or rather, big financial backing is not a necessity, but merit only, and so far the R. I. Whites have shown no tendencies towards such thing as merit.

Personally I think that there are enough Standard breeds to go around, but if someone thinks he can produce a new breed with real merit, or a purpose back of it! who has the patience and money to do it successfully; and will then show consistency and can live up to a Standard, then well and good, and I cannot see why his breed shouldn't be admitted to the Standard, but unless such is the case, I say stop this foolish production.

In discussing R. I. Whites in the Journal, Mr. Vos mentions "freaks" and talks of the Chanticleer. Where does he get his information when he says this breed has no supporters back of it? The Chanticleer was developed as a thoroughly Canadian breed, not stealing this or that type, but of a type of its own. It was not given to the world until a systematic breeding had eliminated the freaks, it was not admitted to the Standard until over 300 specimens had been exam-

ined and 82 per cent proved to be up to Standard; and that was four years ago. At the present writing it reproduces over 97 per cent Standard types. It has the Canadian Chantecler Breeders' Association, with close to 500 members, back of it, with the Hon. J. E. Caron, Minister of Agriculture of the province of Quebec, as honorary president, and about 700 or 800 individuals non-members taking a great interest in it, and breeding it according to very strict rules of the association; and if Mr. Vos cares to have a look at a sample of them he has only to attend the next great Boston show and he will see some of my birds. (How wonderfully well a man can write about something he breeds. F. L. P.)

I am not interested in R. I. Whites, Wyandottes or White Rocks, and it matters little to me whether the Whites are ever admitted to the Standard, but I deny the right to Mr. Vos to sling mud at a breed he never saw or knows little if anything about.

Chantecler has no financial backing in this country because I probably am the first importer of the breed; it has none over in Canada where it originated; but it has much more than that, it has national pride and national acceptance and is bred as a national bird, and it is a Standard bird for all that.

It took the originator of the Chantecler 14 years of study and careful breeding to produce this new breed. He sought to improve poultry raising in bitter Canadian winters, without any thought of remuneration, but the knowledge that by so doing he would in some way alleviate the troubles of his countrymen.

To such a man, let the poultry world in general pay a silent tribute, because he searched not for praise and fine words. Let us point to him as a thorough breeder, a benefactor and a gentleman, and such is the Rev. Brother Wilfrid, of La Trappe, Que.

Let the breeders of so-called R. I. Whites attain the same position with their breed as he did with his, and then they will be entitled to the free advertising they are now getting through the controversy; and to my mind this is their real purpose and intent and the matter ought to be dropped.

Crop-Bound Hens.

Crop-bound is a condition that occurs more frequently with small chicks, but we doubt whether it pays to try to operate on these cases, and most of the crop-bound chicks are stunted and ruined by the trouble so that they never afterwards amount to much.

With old hens the trouble occurs every once in a while, and is due to some obstruction which prevents the food from leaving the crop. The more food a crop-bound hen eats, and the longer the trouble is allowed to run, the more serious it gets, and it finally ends in the death of the hen. Most writers advocate opening the crop and removing the mass, and this is neither an easy or pleasant matter, and in most cases is not necessary. A far better plan is to keep the hen confined for four or five days, with nothing but clean water to drink, and withholding food, so that she cannot aggravate the matter, and it will be found that the mass will gradually dissolve and pass out of the crop. After it is found that the crop is empty, soft food may be given for a few days, and the hen finally worked back to a regular diet.

In all flocks there are voracious eaters, which are in the game from early morning till the last thing at night, and these hens frequently are the heaviest layers in the flocks, and when it is known that crop-bound hens may be saved by simply starving it out, many valuable birds may be saved, and in a way that is not disagreeable to the owner. This is a simple remedy that has worked out well with a number of cases.—Fowls for All.

I have just finished reading H. G. Forster's article in the Journal on "The Costs in Operating a Poultry Farm," and must commend him on his knowledge of the business. I was formerly a cost accountant until forced by ill health to leave office work, and enter the poultry business. Having had no experience in the work I found that I had a great deal to learn. And I must frankly say that I have learned a great many things regarding the costs of production that I would hate to publish in poultry journals.

I wish that other poultry journals would publish such articles as this one of yours. It is only through such true publicity that the public and those who should know are educated to the real facts about the costs of farm products. And right now is the time, when the whole country is stirred up over the agricultural situation.

I also read Mr. Forster's other article about the capital required to build up a one man poultry farm and must say that he hit it very close indeed. Hoping that you will keep up the good work. **Theo. R. Brown.**

BANTAMS.

(By Members of the Pacific Coast Bantam Club)

Why Bantams? First, they are beautiful. Their jaunty ways and saucy defiance of any antagonist make them attractive. They have a very graceful carriage and their colors are brilliant, making them good to look at. "A thing of beauty is a joy forever." They get very close to the heartstrings and afford endless pleasure to the grown-ups as well as the children.

They take less space by half than the large birds; little covered, movable coops, 6 by 4, with a small box as a roosting place, will keep a dozen of them comfortably the year around, by keeping the ground spaded up, with new earth and a grass plat for them part of the time.

They must have covered runs, else you have to haggle their wings, and that spoils their looks. If they can have full liberty, all the better. They eat half as much as a large bird—and still three of the ordinary well bred Bantam eggs will equal in weight two Leghorn eggs. Figure that out and see which is most profitable. A dozen Bantams ought to supply a small family the year around, the table scraps being about half their allowance. In the east, prices for prize stock are away up, and are gradually rising on the coast. Prices run up into the hundreds for some of them.

A variety of Bantams in a yard of large birds of the same variety adds an attraction to anyone's yard; it shows you are a fancier. The aisle in the shows called "Bantam Alley" is always crowded.

Sebright Bantams.

Golden and Silver Sebright Bantams resemble each other in black and white illustrations in all respects as they are, except in ground color of plumage. Golden Sebrights, both cock and hen, should be exactly alike in color, the ground color of different strains show

a good deal of shade from very yellow gold to the dark bay. We have always liked the medium color the best, or, as the Standard calls it, "golden bay."

The ground color of the Silvers is milk white, or just a trifle shaded, called silvery white. The latter we prefer. The lacing of both varieties should be a rich green black or, as the Standard calls it, "glossy black," and each feather should be laced all around evenly without outer fringe of gold or white.

Sebright Bantams should be rather short-backed, short legged, compact bodies, with droopings wings, very prominent chests, head thrown back, tail carried rather high and feathers rather short.

All Sebrights should have slate blue legs and feet. In these varieties there is no need for different pens to breed

Supremacy, 1st Madison Square Cockerel, 1920, 1st Madison Square Cock, 1921.

HOMESTEAD VIGOROUS STRAIN SILVER CAMPINES

They Dominate in the World of Campines

At Madison Square Garden, 1922

Homestead Campines made practically a clean sweep, winning 1-2-3 cock; 1-2-3 hen; 1-2-3-4 cockerel; 1-2-4-5 pullet; 1 young pen. This win, added to their big win at Boston and New York state fair, prove that they dominate in the world of Campines.

Eggs For Hatching

Start right and your poultry keeping will prove fascinating and profitable. You cannot secure a better producing and money making variety than Homestead "Vigorous Strain" of Silver Campines. Eggs—One setting, \$10.00; two settings, \$17.50; extra choice selection, one setting, \$15.00; two settings, \$25.00; Single birds—Females, \$7.50 and up; Males \$10.00 and up; Pens, \$40.00 and \$50.00 and up.

Homestead Campine Farms, Box A, Wayland, Mass.

DAVEY'S MADISON SQUARE GARDEN AND BOSTON WINNERS

males and females, as both sexes are in all respects alike as far as markings are concerned.

We have always been advocates of hatching bantams in May and June, but not later than July. Bantams bred after July may be a tribe smaller, but with good stock to start with the earlier birds will prove the more healthy, and prove more satisfactory.

Game Bantams.

Perhaps if the question "What Is the Most Desirable Quality in Game Bantams?" was put to the average admirer of these interesting little birds, the answer would be spontaneous, "Station." We have come to this conclusion from our experience as judges for over twenty-five years, from conversation with scores of breeders of the different varieties of Game Bantams, and from visits to the yards of many breeders. We beg to differ with all those of that opinion. However, for the good of

Game Bantams we are glad to say not all Game Bantam breeders or fanciers are of the sort that consider a leggy bird a good or typical bird.

Station, good length of thigh and shank, is a very desirable quality, but that requisite in connection with a bird with a long narrow body, long back or long wings that reach past the body, often cross points under the tail, or in fact any one of these objectionable traits or qualities never should be considered a high-class specimen by a real judge or critic. Yet we have noticed many times the blue ribbon on Game Bantams at our best shows that were wider across the hips than at the shoulder, and always this sort of bird is too long in back and body, and most assuredly does not taper from shoulder to stern, or he could not be widest at hips, the center of the body; but these winners had station, and were hard feathered, both coveted qualities, yet his body and back very objectionable, should have placed him below the bird standing next or a few cages from him with wider shoulders, short back, tapering body, and short wings, well tucked up, that was not as long in thigh and shank.

We claim that a Game Bantam with pigeon wings alone can never, or should never, be considered in that charmed circle called high-class. That no Game Bantam is really "classy" that is too long in any one of these sections, viz.: body, back or wings, regardless of how much station he may have or how grandly colored he may be. Nor short in neck, with loose or long hackle, but that a bird (Game Bantam) that has the heart shape, short body, short back, clean stern, short wing, long, clean neck and head, comes under the head of a really high-class specimen, regardless of the fact that he is not just as "reachy" or exactly as clean in-color as you would

like, or as the Standard calls for "shape" makes him a classy representative of his breed.

I am not on the circuit any more as a judge but I am interested in Game Bantams. Don't think I ever will forget Game Bantam shape, and a bird to please me as a show bird, or a breeder, in my yards, must have Game Bantam quality, or get out of my sight. No pigeon wings, or "swell box" bodies need apply, and should I ever consent to judge again at any of our shows, would advise exhibitors to leave that sort at home.

Buff Cochin Bantams.

The Buff Cochin Bantam, when bred true to type and color, is one of the most beautiful and attractive varieties in the Standard. To get color and type takes careful study and foresight and can only be brought about by small matings and pedigree records.

The Cochin Bantams should have small, evenly and nicely serrated combs, broad chest, thick neck, with a short,

broad back, with a nicely rounded cushion, with legs heavily feathered, right to the end of the middle toe.

First take the male and go over him from head to tail, make a record of his weight, color in each section, undercolor in each section, head, color of eyes, shape of head, comb, neck, breast, back, tail, wings and foot feathering. The tail is one of the important sections and

should be short full and soft feathers.

Now select one or two hens and have them particularly strong in type and color where the male is deficient. Know if possible each hen's eggs and set them separately and mark the chicks so you will know which hen produces the best stock. Do not be in a hurry about selling the old birds as they may produce some top notchers and you may want to use this mating or part of it for next season's breeding. So much for the fancy part, and now for the utility, as layers, setters and mothers for chicks the Buff Cochin stands A-1. For eating purposes there is no better table fowl. They make plump broilers and roasters as their meat has a very fine flavor. With just a little care in selection at breeding time one can have an ideal family fowl in the Buff Cochin Bantam.

The Black Cochin Bantam.

The Black Cochin Bantam of today is one of our most beautiful Bantams. It has progressed toward perfection with "leaps and bounds." Nowadays it is not

unusual to see a pen of loose, full-feather, low-down Cochins, with a coat of black that reflects a lustrous, bronzy-green sheen, when enjoying the rays of the sun.

The Blacks and, in fact, all Cochins, are very docile and very easy to keep penned. The black will have a tendency to turning red or "burning out" under the rays of the sun. Many of our real fanciers use canvas or burlap to shelter their pets during the hot sunny days of summer. Our old-time breeders contended that it was impossible to obtain high-class exhibition specimens from a single mating.

The Black Cochin of today has reached a plane very near perfection and now it is possible to obtain both high-class males and females from one mating. To do this only rich colored birds of true Cochin type need be used, otherwise the time is wasted. Never use a bird that isn't black to the skin or one that has yellow legs for a breeder.

Black Cochin Bantams should have horn colored legs. Sometimes an exceptionally good bird will throw a white feather or two; more than likely they will be lost in the next molt. Look out for white in the ear-lobes. Do not breed a bird with this defect under any consideration. Also avoid pearl or white eyes as this is a serious defect.

The Silkie.

The Silkie is a native of Japan and have become quite popular of late owing to the fact that they make such excellent setters and mothers to hatch and raise Pheasants. Many of our most prominent breeders of high-class exhibition poultry use Silkies to hatch and rear their pedigree stock. I have found that by keeping about one dozen Silkies that I always have some that wants to set from Jan. 1 on until June and us fanciers know how fine it is to be able to set some of our choice eggs during January, February and March and not break into our regular matings. As layers the Silkie will hold her own for when she is not setting she is laying and when she is not needed for setting she can be easily cured of her broodiness by putting her in a slatted bottom coop and fed on dry laying mash. Most people do not like the idea of eating Silkies owing to their having dark meat. It is claimed, however, that their flesh is very edible and tastes more like that of wild duck.

Cost of Breeding.

One big breeder says: "Of course, we could save many thousands of dollars if we dropped down just a little from the high standard we have set. We could cut out tramping and save \$6,000.00 a year. We could omit all pedigree work and save an equal amount. We could run our birds in large flocks, instead of in small, especially mated pens and save \$4,000.00 more. And the special equipment, the wide flung colony houses, the special feeds and little details that add the final touch of quality to the stock, run up in other thousands."

How to Build Poultry Houses

A new book just out, devoted exclusively to the building of poultry houses of all kinds and descriptions. Besides telling how to build the houses properly, it tells how to make feed troughs, nest boxes and water troughs. It gives complete plans, as well as the approximate cost of construction. It also contains plans of roosts and dropping boards; the brood coop; the brooder house; the fattening coop; the Winter brooder house; the fattening coop. 75c postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

Early Laying Show Birds.

The Golden Rule policy is the only permanent assurance of success in any business, and that is why we adopted and try to live daily "the square way of dealing" with our customers.

Poultry keeping with me had always been more or less a hobby, and the birds were kept more for pleasure than profit. Eight years ago circumstances compelled me to retire from my active work—the transfer business. It was then I thought, and thought hard, of how I could make the poultry business pay, and the quickest way to grow from a small beginning with the greatest possible returns.

We (the wife and I) always kept a record of our income from eggs. We could always sell at a premium, winter or summer, all the eggs our flock would produce, and we found our cash from that source always left us a margin of profit.

Our laying house was fully equipped, artificial light for the short days of winter. Trap nests and the other ways of determining a hen's capacity were closely studied and adhered to. The light breeds appealed to us, and eggs—plenty of them—were what we determined to get.

White Leghorns, Reds and Anconas comprised our flocks, but we eliminated the Reds after two years of record keeping and now we have only the Anconas. The Leghorns didn't respond during the winter months as well as the Anconas, and that was when we needed eggs the most.

We never force our breeding stock for winter egg production, for we have found by experiments and taught by common sense that this method could only result in poor hatches and weakened chicks. Our specialty is birds that will reach early maturity and the laying stage in the quickest possible time, and in order for them to do this, they must come from a strong germ and be a vigorous chick at the start.

Laying hens have always been, and are today, our first consideration. Showing for premiums on Standard birds had never, until a year ago, appealed to us. While we have always bred our birds so that they conformed to the Standard, as near as possible, without sacrificing anything which would tend to lower their laying qualities, we never put a bird in our breeding pens that didn't have a laying record to back it up.

Our attention was called to some of our birds by breeders who specialized in show stock. This set us to wondering why a bird couldn't play a double role. We know of fine stock breeders who can win at fine stock shows with cattle that produce far above the average in butter fat. Why, then, couldn't a heavy-laying hen or pullet come up to the Standard in the show-room and still produce far above the average in eggs? We gave the matter a tryout at the Omaha Show, Thanksgiving week, entering three birds. We won first cock and premiums on the other two entries. New Year's day, at Lincoln, Nebraska, we entered fourteen birds and won: 1 old pen, 2 and 3 pullet, 3 and 5 cockerel, 2 and 4 hen, 2 and 4 cock—fourteen birds entered and won on them all. These birds were right out of our trap-nested stock, and aside from a little conditioning, nothing was or could be done to breed them up closer to the Standard of Perfection. They were simply Standardbred layers that demonstrated their value in the show-room.

Early-laying show birds are going to be our specialty in the future, as long as we can breed as we have been breeding. No special mating or extra effort was required to get the winners we showed.

On exhibition at Lincoln we had a pullet that laid her first egg at four months and two days. This might seem abnormal and freakish, but we have several more hatched at the same time that laid in four months and eighteen days. We can only account for this by the parent stock which produced them and our manner of feeding. Too heavy feeding the first four weeks of a chick's life seems to cause a reaction. We have found that an underfed bird, unless stunted the first month, will, by proper handling and feeding, reach maturity in a more developed condition quicker than one crowded from hatching time. This is our only known solution of our early layers.

Our ambition is to manage an immense poultry plant, and we are striving daily with that end in view. We know of no other business so fascinating and healthy that can be worked up from a small beginning, with so little capital, than poultry raising. Any person with a determination to succeed can accomplish their purpose if they will adopt the Golden Rule as their motto and, no matter what the temptation, see that the rule is never violated. Common sense, coupled with a talent for the business, and the above rule

Little Journey Among Anconas

Some night take this "Little Journey Among Anconas"—it will fascinate you!—and you will profit immeasurably from the experience. Between the two substantial covers of this latest book by the Ancona specialist, H. Cecil Sheppard, is packed all the meat of Ancona history and experience since the early discovery of this prolific breed. Mr. Sheppard's amazing winnings for many consecutive years at Madison Square Garden, New York, entitle him to write the leading text book on Anconas.

"A LITTLE JOURNEY AMONG ANCONAS" is offered postpaid for \$1.00. It will show you how to get more profit and greater pleasure from your poultry.

H. Cecil Sheppard

Box 439

spell success. Specialize in whatever branch of the business you go after, and as the business grows, put a certain amount of the profits in well-placed advertising, which money spent should be considered an investment and not an expense. Treat your customers good and all alike, and should a question of doubt arise, try and give the customer the benefit of the doubt, and your business will keep on the upward trend. "Biddy" is a firm believer in co-operation, and if you do your part of the co-operating she will do her's.

C. WHITNEY.

Nebraska.

A Mexican Breeder's Complaint.

Some time ago, I wrote you on several poultry problems we fanciers down here were confronted with, and what called your attention most was my statement that a hen purchased in the States averaged twice and more of its value when brought down here. To prove my statement, I hand you herewith a custom house agent account covering my importation of eight Cornish pullets.

These pullets cost me at point of origin \$2.00 gold each, or \$16.00 in all. The custom house agent account to cross this coop with eight pullets totals \$35.58 gold, which makes a grand total of \$51.58 gold laid at the border. The expressage on same to Monterey was \$1.85 gold, which added to \$51.58 which we were carrying makes \$53.43 gold for the eight pullets, or \$6.68 gold per pullet, or in round figures, more than twice its value.

To show you there is no fake in my statement, I am handing you herewith the account as it was rendered me, the express receipts and the letter from the custom house agent enclosing the account. Everything is here to support my statement.

Now, after looking over these facts, what do you think ought to be done with a breeder who sends you the worst culls he has in his yards? In the States, when you get a chicken not worth the price, or equivalent to what the breeder has promised you, you just return it, but here, if you were to return the chicken you would have to pay again the same amount for exporting it that you paid for importing it, which would make the value of the shipment a great deal higher than the value of the birds purchased.

And this is not all. In bringing in pit game hens and cocks, you find that they charge you more, because the value of the hens are more, and besides they do not fail to steal one or two hens and put in a mongrel or two to cover

their theft. If you make your claim to the custom agents they will tell you that that was what reached them; if you make it to the shipper he tells you he shipped only first-class goods; if you make it to the Mexican government, after a year or so they tell you the theft occurred in the United States, and if you make it to the American Government they tell you that once the shipment crossed the border they are not responsible, so who pays after all? The fellow who gets the hens.

Two days ago I purchased a trio of Buff Orpingtons. One of the hens has only one wing. The other wing has never existed. I suppose it is a freak or some kind of degeneration, as you cannot find even the stub of the wing.

I know it is of no use to write the shipper—he will tell you he never shipped such a thing, and I know it is no use to write the custom house agent, as he will tell me he shipped me just what he received.

I must state to you, in order that you will not mix things up, that the American express companies do not deliver things into Mexico. They just put them on the border and you have to hire a custom agent to pass them over, so don't figure on having the express company bringing it right straight from there to the door of your house.

Now I want to ask the fraternity, is it just that they send us trash when it costs us so much to obtain our animals? Is it just that they send us trash knowing that we cannot return same, on account of the expenses connected with it? Is it just, I say, that they ask a higher price for export than for import when we are going to get the worst kind of hens? The fraternity should take into consideration that we are not competitors, as we are not going to show our birds, for there are no shows here; that we are not going to take ribbons and prizes away, as we are only in the business in this country, and with these thoughts in mind they could ship us better birds than for their local trade.

I am glad to learn that you are interested in learning about conditions here, and you may rest assured that if it was not for the terrible expenses in the matter, the poultry business here would have a different face.

FRANCISCO BELTRAN, JR.

Mexico.

(Note.—A breeder who ships a hen with a wing deformed to the point of absence is dishonorable. Such a bird should be consigned to market. Mr. Beltran should appreciate

the fact that \$2.00 is not enough to pay for a Cornish female. At current market prices in the United States a Cornish hen will bring that much on the butcher's block. If he had paid \$16 for two hens, any reputable breeder would have sent decent females, and these birds would have produced some forty chicks, among which should be some satisfactory cockerels and pullets.—F. L. P.)

Hens Must Have Mash Regularly.

The fact that a satisfactory egg production cannot be maintained without the regular use of mash in the ration has been sufficiently demonstrated by flock records from all parts of the state. Yet probably the most common reason found for the low average which some flocks still show is the fact that the owners are careless in keeping the mash supply constantly available. Many excuses are heard for the condition where three-fourths of the flocks has molted early in August, but in almost every case a little investigation will show that the birds have not been given their mash regularly during the summer months. In the opinion of the writer, the one most important object lesson which all farm poultry keepers need to learn is that egg production is determined directly by the kind and amount of feed given and that in order to insure heavy laying the hens must be fed their grain regularly and must have dry mash continually available. Moreover this dry mash must contain animal protein in some such form as commercial meat scrap or tankage if the birds are to lay profitably, unless enough milk is available to give the hens all the milk they will drink every day.

—T. S. Townsley.

Trio of Sheppard's Rose Comb Anconas, first Rose Comb cock, hen from the first Rose Comb old pen and pullet from the first Rose Comb pen, Madison Square Garden, New York. Owned by H. Cecil Sheppard, Berea, Ohio.

Classified Advertisements

UNDER this heading ads will be inserted for fifteen cents per word each month for less than three months, or *thirty-six cents per word for three months*. Changes in copy allowed every three months. Numbers and initials count as words. All ads will be inserted under *classified headings*. No ads accepted at less than an average of \$1.50 per insertion. Terms, cash with each ad. Count the words carefully to avoid delay in publishing. Write your copy plainly, as upon this the correctness of your ad largely depends. When placing your ads remember that advertisers using Classified Ads get better returns from AMERICAN POULTRY JOURNAL than from any other poultry journal—none excepted. On writing any of these advertisers, mention AMERICAN POULTRY JOURNAL. All copy for Classified Ads must reach us by the 17th of month preceding the date of issue. These Rates Void After May 20th, 1922.

S. C. WHITE LEGHORNS.

NORTHLAND WINTER LAYERS—Our beautifully illustrated catalog shows life-like reproductions of our English Single Comb White Leghorns from Tom Barron's highest egg pedigree blood lines—pronounced the finest specimens ever shipped to America. Our females are of the big lopped combed type mated to heavy, powerful males, fairly bubbling over with vigor. February report of the Illinois National egg laying contest shows our pens in 2d and 4th places in competition with several hundred picked birds from the leading commercial breeders of the United States. We have already won 19 certificates of award in this contest for high pen and individual records. After May 1 we will cut our price on chicks from full sisters and dams of these high record official trapped females to \$18 per 100, and after June 1 price will be reduced to \$13.50. Hatchings eggs now \$9 per 100. Northland Farms, Dent, A. Grand Rapids, Mich. 4

KILL LICE

THE BEST AND SURE WAY

Protect your fowls from the powerful and insidious lice and mites that suck the life-blood of your birds.

These parasites allowed to run rampant in a hen house will suck more blood, more vitality over night than fowls can replace by the assimilation of large quantities of food during the day—think this over.

Extra care must be taken that not only the birds are kept clean, but every crack and crevice as well.

Licecil

Kills Lice

**No dusting—No dipping—No painting
—Just hang up the bottle**

—and in a few days your entire flock and hen house will be rid of every louse and mite. Licecil leaves the bottle in powerful evaporating vapors which descend in a misty form, penetrating feathers, cracks, and crevices everywhere. Lice and mites have no lungs. They breathe through the pores of the body. The vapors from Licecil will quickly kill them. They cannot stand the odor of Licecil, and its presence in your hen house will rid you of these pests.

How to Use Licecil

Simply put a few drops in the nest and on the roosts, hang the uncovered bottle in coop or hen house. The powerful evaporating vapors which leave the bottle descending in mist form penetrate cracks, crevices, everywhere. Lice, mites, chiggers, roaches, bed bugs, ants, etc., will be destroyed by Licecil vapors. Will not injure chicks.

GIVE IT A FAIR TRIAL

If you prefer to fight poultry pests in the old way—it is certainly your privilege to do so. But your own best interest, and the success others are having, will lead you to give Licecil a fair, honest trial at the earliest opportunity.

1 Bottle, \$1.00; 3 Bottles, \$2.50; 12 Bottles, \$9.00—All Postpaid.

Chicken Mites Filled
With the Life Blood
of Faithful Hens.

THE END.

Evidence!

KEEPS ON USING LICECIL.

Please find checks for \$5 for which send me six bottles of Licecil. I have been using Licecil and find it O. K. This is the third order, which speaks for itself.

J. D. ALLEN, Lynchburg, Va..

WANTS MORE.

I am sending for some more Licecil. It is the best preparation to rid the place of lice I have ever found. Send as quick as possible, because I am all out now.

JOHN HOLTRAP, Lynden, Wash.

KEEPS ON USING IT.

Find enclosed money order for Licecil. I was well pleased with results from the other bottle I bought. Have over 200 birds and when I use Licecil lice are a very scarce article with me.

J. E. PLATT, Maywood, Ill.

LITTLE WORRY OR WORK.

Please send me three bottles of Licecil. Like it very much. With Licecil there is little worry or work. Enclosed find money order for \$2.50 for the three bottles.

BERNARD F. OSTERFIELD,
Dayton, Ohio.

SEND MORE.

Please send me three bottles of Licecil. I received the one bottle ordered recently, and have had splendid results. There is one thing sure, no lice or mites will stay on the chickens with the odor of Licecil about.

L. G. STAYNOS,
Sherman, Texas.

Old Pens	1st, 2d, 3d, 4th, 5th

60 Prizes Out of 60 Offered at Both Shows

Sweepstake Championship Male and Female and Every Special Prize—This is the crowning achievement of their unexampled record at New York for more than 30 victorious years. At the five Garden Shows—1917, 1918, 1919, 1920, 1921—THE IMPERIAL "RINGLETS" won 27 First Prizes out of 27 offered—Every Bird Bred on My Farm.

The competition at these shows was stronger in quality than at all the other shows of America combined—a fact that every breeder knows only too well.

Supreme at Madison Square Garden
Is Supreme Everywhere

IMPERIAL "RINGLET" EGGS

During the past ten years the matings on my farm have done more to improve the Barred Rocks of America than all the other matings of the whole country combined.

You want eggs to produce the Silver Cup and Blue Ribbon winners for next season's shows. No other Barred Rock eggs have ever produced the extreme high quality birds as my Imperial "Ringlets." Hundreds of old customers order eggs every year—these eggs have brought them rich rewards in Silver Cups and First Prizes, and proved the foundation for many a money-making business.

My Imperial "Ringlet" eggs will place you in position to win at next season's shows. You may raise a single chick worth hundreds of dollars—hundreds of my customers have done this. **MY MATINGS ARE UNEQUALLED IN AMERICA.** No such magnificent color and barring can be found on any living birds—as layers they stand pre-eminent.

I Ship Eggs From Finest Matings on My Farm

My Eggs Are the Best Money Can Buy — They Produce First Prize Birds

M. E. B. Thompson, Amenia, N. Y.

Dear Sir: Got to have another setting of eggs to insure my reputation for another year. In the Walla Walla Show held in January I won 1st on Barred Rock cockerel, also grand Sweepstakes Champion, on the same bird, for best bird in the show of all breeds; 1st, 2nd and 3rd on pullets. These birds were hatched from the setting of eggs received from you last April. The IMPERIAL "RINGLETS" sure take the lead wherever shown. We showed against birds that had taken everything here for years.

Yours very truly,

Chas. C. Wright.

Raise 'em The FUL-O-PEP Way

The Ful-O-Pep Way of Feeding chicks has changed the old expensive "grain feeding way" and has proven to poultry raisers that the old method of grain feeding is all wrong. The Ful-O-Pep way of feeding

Gives You 1 Pound of Gain at Cost of 2 Pounds of Feed

instead of only 1 pound of gain to each 4 pounds of feed, which is the basis of figuring cost of production arrived at by experiment stations covering several years experiments with grain feeding. Why continue to feed this old expensive way when the Ful-O-Pep Way will give you the same gains with only half the feed?

FUL-O-PEP GROWING MASH

Costs Less Per Pounds of Gain Made Than Any Other Feed

The Ful-O-Pep Way consists of feeding Ful-O-Pep Growing Mash from the very start—continuously keeping it before your birds all the time. Ful-O-Pep Growing Mash, because of the high feeding value of its Oatmeal, fish and bone contents goes twice as far as green feeds—every ounce is digested by chicks delicate digestive organs—there is no waste and when compared with results, costs only half as much in pounds of feed consumed for gains in pounds of meat produced. Furthermore, your losses from bowel and digestive troubles that arise from feeding hard, indigestible grains, will be very much less and your

flocks will be of even growth and development. Give the Ful-O-Pep Way a trial this season—it will reduce your feed costs and materially increase your profits. Your dealer can supply you. Write for Free Ful-O-Pep Poultry Calendar—learn all about the Ful-O-Pep Way.

What Users Say about The FUL-O-PEP Way

The Quaker Oats Co.,

Gentlemen:—Regarding results of your poultry feeds, I followed the instructions given in the FUL-O-PEP Poultry Almanac as a test. Fed nothing but Growing Mash, followed by greed feed, such as lettuce or sprouted oats at noon, and a good feed of your Chick Feed at roosting time, plenty of clean fresh water all day. Grit and charcoal was within reach at all times. The mash was fed in hoppers so the birds could eat when they felt like it. I tested the feed with a mixed flock of thirty birds made up of Black Minorcas, Rhode Island Reds and Plymouth Rocks, and I can truthfully say that I have never seen chickens mature so fast.

Very truly yours,

ALBERT T. HIXSON.

419 Hayes Ave., Jackson, Tenn.

The Quaker Oats Co.,

I have been feeding FUL-O-PEP GROWING MASH to my chicks this season and it is by far the best feed I ever tried. Cockerels 3 months old weighed 3 to 3½ lbs. Cockerels in one flock gained 1½ lbs. in 31 days, while some put on 1 lb. in 18 days. Yours very truly,

E. J. ACRE, Brazil, Ind.

The Quaker Oats Co.,

I began feeding FUL-O-PEP GROWING MASH to 58 chicks when they were one week old. To date I have not lost a chick, and at 5 weeks of age they average 13 ounces or more. FUL-O-PEP GROWING MASH surely puts "pep" in growing chicks.

Yours truly,

E. T. NEFF, Derby, Ohio.

What the Ful-O-Pep Way Does for Others, It Will Do for You

361 Eggs Between Molts World's Record!

Hatching Eggs from this Famous Strain at Special Cut Prices

You can now get eggs from the great Holterman "Aristocrat" Barred Rock Strain at cut bargain prices. Please bear in mind, these prices hold good for May and June only.

And remember, the fertility of these eggs is so great that I *absolutely* guarantee you will hatch ten chicks from every setting of fifteen eggs. Many customer report a full hatch of 15 chicks.

Send today sure for Special Bargain Egg List and Free Catalog.

YES, that is exactly what we mean! "BUSY BEE," a pullet hatched from a Holterman Barred Rock Egg, and owned by Mr. Gulick of California, *laid a total of 361 eggs between molting seasons*—probably a world's record.

"Furthermore," writes Mr. Gulick, "four more hens, hatched directly from ONE setting of your eggs, *laid a total of 962 eggs in their pullet year*. Your eggs are truly marvelous."

AND READ THIS!—"I hatched 10 chicks from the 15 "Aristocrat" eggs you sent me, and at Michigan's largest show 8 were prize winning birds." Think of it! *Eight winning birds from one 15 egg setting* That's the experience of Mr. G. E. Severance of Michigan.

Scores of letters like these prove the tremendous value of Holterman's method of mating pedigreed, linebred *Barred Plymouth Rocks*—finest for Exhibition and greatest in Egg Laying.

Barred Rock Hens The BIG MONEY Birds

My "Aristocrat" strain of Barred Rocks is today famous the world over. I have specialized for years in Barred Rocks, and now more than ever, I am convinced that *they are the biggest profit fowls bred*.

The poise, beauty and dignity of the Barred Rock makes it supreme for exhibition purposes. Furthermore, it is in great demand as a market fowl, and, better still, the most dependable of all egg layers.

Send the Coupon Below for My New FREE Catalog and let me show you how you can have—not only one—but a *big flock* of Egg Record, Winter Laying Barred Plymouth Rocks.

The Most Amazing Breeding Males in the World Today

Yes, and I mean it. I truly believe no other group of cock birds in poultry history has produced such a big number of Prize Winning birds as have the famous males on my place today.

Reports from customers tell me of big victories in Canada, Mexico and every State in the Union—won by birds hatched from my eggs.

I want you to send for the FREE catalog and read all about my World-Famous Group of Breeding Male birds. These birds head my special matings, and from these same birds come the eggs to fill your order. You may yourself easily raise a chick from one of my eggs worth hundreds of dollars.

New 1922 Catalog **FREE** and Cut Price Egg List

This new 1922 Illustrated Catalog contains a world of information on How to Mate and Breed Barred Rocks. It is one of the most valuable poultry catalogs published, and it is your's FREE for the asking. I want every truly interested person to have this booklet.

We will also send you the May and June Cut Price Egg List telling all about "Aristocrat" Eggs, and quoting prices so low you will be amazed.

Send this Coupon NOW

Simply fill in this Coupon and mail it to us, or, if you prefer, send your name and address in a letter or on a postcard. The day we hear from you we will at once send you the New 1922 Catalog and Bargain Egg List. Send the Coupon or write today sure.

We give the most far reaching guarantee on both incubator and brooder that any responsible concern can offer on their product.

The Schwalge
Fresh Air Brooder

(Patent Pending)

Provides FRESH AIR BELOW THE HOVER—PREVENTS CROWDING—two very essential features. No lamp fumes can enter below the hover and the same heating principle is applied as to ours or any first class incubator. Fresh air continually circulates FROM THE CENTER OF THE HOVER to the outside. The chicks, INSTEAD OF CROWDING TO THE CENTER move away from it and lie in a circle near the outside of the hover. Hover 4ft. in diameter. Accommodates 500 to 600 chicks. Price \$28.00 without platform.

BYERS' ORPINGTONS

Supreme Quality Buffs, Whites and Blacks

Small deposit insures reservation.

EGGS From my finest CHAMPION EXHIBITION MATINGS now Half Price—\$7.50 per 15; \$14 per 30; \$22.50 per 50; \$42.50 per 100.

EGGS From my Special Matings of Champion Blood are now—\$3.75 per 15; \$6.50 per 30; \$10 per 50; \$18 per 100.

All Eggs shipped prepaid and all infertile eggs replaced free. Fertility is now running practically perfect. Buy into this supreme quality line for the finest Orpingtons in all America.

C. S. BYERS *Orpington Specialist for 21 Years* **HAZELRIGG, IND.**

NOTE—You have followed my page advertising in this Journal during the past winter. The sterling merits of my Strain have constantly been unfolded to you in this leading publication covering a period of many years. Through correct methods and the delivery of maximum values I have gained the confidence of thousands of the leading Orpington breeders throughout America. This priceless confidence will be maintained and the double values announced in this advertisement will be delivered.

C. S. BYERS.

Wyckoff's S. C. White Leghorns

... America's Business Hen ...

Remember that we are the originators, and for over 40 years specialty breeders of the justly celebrated WYCKOFF STRAIN of S. C. White Leghorns, the most prolific strain of poultry in America today. Place your order at headquarters and make no mistake.

SPECIAL ATTENTION is directed to the fact that, almost without exception, the most successful Leghorn egg farms in the country, and those making the highest records at the greatest laying competitions in the world have been proven to be of Wyckoff foundation.

EGGS FOR HATCHING

from the most carefully selected matings. Our breeding matings for 1922 are made up with the most exceptional lot of carefully selected stock in the country, barring none. Every egg furnished will be from a grand lot of special selected birds, representing our highest quality stock in every particular. For size, strength, vigor and laying qualities, together with the true Leghorn type, they are unequalled. **POSITIVELY NO SECOND GRADE OR IMMATURE BIRDS MATED, AND NO ORDERS FILLED WITH EGGS FROM "FARMED-OUT" STOCK OR OTHER BOUGHT UP JUNK. WE ARE BREEDERS, NOT HUCKSTERS.** Place your order for some of the eggs from this famous high grade stock, and get in line with the most profitable era ever known in the poultry business. Send for free catalog giving prices and descriptions, with numerous photographic illustrations showing type of the birds and sections of this most completely equipped plant.

Queensbury S. C. White Leghorns

NEW LAURELS WON BY OUR FAMOUS BIRDS

Our pullet 79-3 at the Vineland International Egg Laying Contest breaks all records for persistent winter laying. To date she has won certificates every month since last November and is still going strong. From November 1st to January 31st, she laid 75 eggs in the 92 most severe winter days of the year. The entire Queensbury pen—although handicapped by the loss of one bird by accident and being obliged to finish the year under these conditions—laid 317 eggs in February and thus winning highest honors for the month.

Queensbury birds are bred for winter eggs and they lay them. We have hundreds of vigorous, free range pullets with the same blood lines as the wonderful contest birds and we are offering them for sale at eight weeks and older at very reasonable prices. If you want to make money from hens get our famous pedigreed stock and make a reservation at once if you want them shipped promptly and even if you want them later, order now and be sure.

Stand Pre-eminent

Their record as the foundation blood for other good flocks all over the World. Their show record in my hands or those of customers of Owen Farms at large and small shows all over this country and abroad. Their individual egg records in trap-nests and flock records as layers wherever they have gone. Their pre-potency, stamina and vigor; and their ability to make good for their owners, have all been factors in establishing their supremacy.

The permanency of Owen Farms' business has been assured by the genuine values given, and the "Golden Rule" treatment accorded to every customer. This is the reason that many hundred orders come each year from old customers, and why "Once an Owen Farms Customer, Always a Customer of Owen Farms" has become a truism.

The 1922 Egg Trade

Has taken every good shelled egg produced that has not been set here on the Farms. Many thousands of Owen Farms chickens are growing or hatching all over the country. The average quality will be the finest ever produced. Hundreds of these youngsters will develop into winners for egg customers of Owen Farms. Hundreds more will be hatched between May 25th and July 15th. June is the month of roses and also the month to hatch Red and Buff pullets that will be in bloom and will win the large shows from Thanksgiving week on. My customers who are ordering for June delivery are wise and will have pullets just ripe for hot competition and not gone by.

Those of you who have not already ordered for delivery after May 15th will be glad you did so if you order now and take advantage of the half price rate and hatch winning pullets during June and July.

I will hatch here until July 1st, or a little later, as I want pullets for January and February showing.

Half Price Egg Sale Commences May 15th

Look up my mating list. If you have not a copy of the list, it is yours for the asking.

Half price eggs from my finest matings will be \$12.50, \$9.00, \$6.00 and \$3.00 for 15. Combined sittings of Group 2 and 3 will be \$7.50 for 15. Group 3 eggs for \$30.00 for 100, and Group 4 eggs \$15.00 for 100, are wonderful value for a small sum.

Half Price Stock Sale

Will give you fine tested breeding birds for just half their value now. You can carry them over for 1922 breeding or showing. At no other time of year will your money go quite so far in securing choice birds at a low cost. Write me your exact wants, and, if you will, the amount you wish to invest; I will write you fully and advise you to the best of my ability. See how close we can get together through correspondence. Come and visit Owen Farms if you can. If this is not possible, come to me by mail.

AMERICAN POULTRY JOURNAL

Volume 53

Chicago, Ill., May, 1922

No. 5

Review of the Standard Committee's Work

By Theo. Hewes

By Frank L. Platt

SINCE 1888 I have been directly or indirectly connected with the work of the Standard Committees that have had charge of revising the American Standard of Perfection. And since I have served longer on the Revision Board than any other one member of the American Poultry Association, a look backward at revision, and a review of the work that has been done by the Revision Boards, together with direct reference to the report that will be submitted by the present Revision Committee at Knoxville may be of general interest to the present day breeders of America.

When I first became interested, Standard revisions were made in connection with poultry shows where the American Poultry Association was holding its annual meeting. The first general Revision (aside from the annual meetings) was held at Fisher's Island, New York, and since that time the Revision Committee has met and prepared the text of the Standard at some place separated from the conventions of the Association, and their reports have then been submitted to the regular meetings of the Associations wherever such meetings were held.

During my time as a member of the Revision Committee, I have served with many of the best informed breeders and judges from all parts of the United States and Canada, and I can truthfully say that at no time have I ever served on a Standard Committee when there seemed to be a disposition on the part of any member to take advantage of his position and suggest and work for Standard changes that would be detrimental to the best interests of Standardbred poultry, and I know without question that there has never been a text prepared for any breed or variety that did not take into consideration the utility value of the breed and always have the Standard Committees aimed to so word the Standard text descriptions of the breeds that the best possible results would come from breeding birds of Standard type. The only exceptions have been in those cases where specialty clubs with large memberships have brought such pressure to bear upon the Revision Committee that their

(Continued on page 636)

THE Standard Revision Committee was still in session when the April issue of the Journal went to press. In fact, copies of the April issue were delivered to the hotel before the last of the committeemen left for their homes. It was necessary therefore, for us to hold over until this month a report on the last few days of the Standard Committee's work. That additional report appears on page 606 of this issue.

Before final adjournment, the committee reviewed its work, going over the stenographer's type-written copies with great care. A few points were reconsidered, especially the color of the Ancona male, and the undercolor of Red Sussex. We give these final changes in this article. Some comment on the work of the committee, as the same affects the different breeds and varieties, is also given.

It is the committee's desire that the breeders of the country shall have as full information on the proposed changes as possible, and for this information they will have to depend on the press. It was expected that every change made would be put in printed form and mailed to the membership of the American Poultry Association. This, however, can not be done. The President stated that the finances of the organization would not permit it.

We hope that the breeders will read carefully this review of the Standard Committee's work. A general revision occurs only once in eight years, and every breeder should gladly take the time once in eight years to carefully analyze the changes that are proposed in the Standard of Perfection by which all purebred poultry is judged.

The Standard Revision Committee will hold a meeting just prior to the A. P. A. convention which is to be held August 1922, in Knoxville, Tenn. At that meeting alterations may be made in the report that the Standard Revision Committee is to make to the convention. If any breeder has any suggestions that will make the 1923 Standard of Perfection a better Standard, he should submit them in writing to E. C. Branch, chairman of the Revision Committee, Lees Summit, Mo., so that they may be brought before the committee just prior to

American Wyandotte type is being seen to good advantage in Europe, as shown in the 1st White Wyandotte pullet at the Utrecht, Holland, show, December, 1921.

the Knoxville meeting. If any member has any objections to the report of the Standard Committee, the time and place for him to bring up his objections is the floor of the annual convention of the Association at Knoxville in August of this year.

The reason we urge every breeder to submit all proposed changes to Chairman Branch, so that they may be embodied in the report of the Standard Committee, upon consent of the committee, is this: At the Knoxville convention the presiding officer can entertain motions to accept, reject or amend the recommendations of the Standard Revision Committee, and it is not expected that he will throw open the Knoxville meeting to action on changes not regularly brought before it by the Standard Committee. The constitution reads: "The committee on Standards must report to the Association at each meeting, either favorably or unfavorably, on all such proposed changes." Action will be taken on those recommendations.

It is the desire of the Standard Committee to make the 1923 Standard the best edition that has ever been given to the breeders of America. You will find the committee not only willing but eager to do its level best. There are necessarily differences of opinion. These can be adjusted at the convention. For instance, the committee recommends that the back shape of the Wyandotte shall be changed from "short" to "moderately short." You may hold the opinion that the Wyandotte back is of "medium length" and the character of the plumage makes it look moderately short. You are at liberty to make your argument on the floor of the convention and ask that "medium length" be substituted for "moderately short." If the Standard Committee, however, had proposed no change whatever for back, no proposition to change the back could be entertained by the convention. The business of the convention is to adopt, reject or amend the proposals of the Standard Committee. If it were not so, no Standard Committee would be needed; the convention could meet, propose its own changes, and turn over its instructions to the editor of the Standard. As it is, the A. P. A. will pay out a thousand dollars to the members of the Standard Committee that met in Chicago in March, for the purpose of securing a report from them, and if you want any additional changes embodied in that report, you must submit them forthwith to Mr. Branch.

Varieties Declared Obsolete

White Missouri Fluffs, Rose Comb Black Rhinelanders, Slate Turkeys, Rose Comb Buff Leghorns and Red Pyle Leghorns were recommended as breeds which should be omitted from the 1923 Standard. Although these varieties are now Standard, having been admitted by the vote of previous conventions, and three of them appear in the present edition, they are rarely seen. When this matter comes up at Knoxville there will probably be no contest on Missouri Fluffs, as their distribution has ceased. Silky feathered fowls infrequently occur in many different varieties, such as Black Langshans, Rhode Island Reds, Black Orpingtons, White Rocks, etc., and when these abnormalities

are bred and perpetuated into a variety, such as the Missouri Fluff, it really has no place in the Standard, except perchance it should by some miracle become a decidedly popular variety.

There is one breeder of Rhinelanders in California. To all appearances, which is the only way a judge can judge, Rhinelanders look like Rose Comb Black Minorcas of lesser degree, having no distinctive breed characteristics. Although admitted to the Standard, this breed is practically unknown, and the Standard Committee will recommend that they be declared obsolete.

Slate turkeys are rarely seen.

Rose Comb Buff Leghorns are bred by a number of

breeders. There will probably be some protest on the action of the committee in recommending that they be dropped from the Standard. From the specimens shown at the last Madison Square Garden show this variety is not on as high a level as other varieties of the Leghorn breed. Red Pyle Leghorns virtually died a-borning. One breeder in New York state developed them, but it would be pretty hard to find one cataloged at the New York, Boston or Chicago shows in the past five years. Why carry such dead wood? It costs money to devote page after page in the Standard to obsolete or unworthy varieties. Of course, the United States and Canada cover a great deal of territory, with many millions of people. It may be that these so-called obsolete varieties are bred by many more members of the A. P. A. than the Standard Committee could imagine. If there are a dozen breeders in North America who are breeding and exhibiting

Striped feathers from the Columbian or Light Brahma male. The feather on the right carries the V-shaped stripe to be called for in the lower saddle of the males of these varieties.

any one of those varieties, who are enough interested to write Chairman Branch and set forth the actual status of their variety, the Standard Committee will most humbly consider their interest. Such was the attitude of the committee.

This marking of breeds obsolete is a serious business, and is intended to arouse breeders to put on their thinking caps. To make the matter more concrete the Standard Committee adopted a resolution to the effect that it is the sense of this committee that in future revisions, breeds which are neither adequately bred nor exhibited, so as to be generally known, shall be dropped from the Standard.

New Breeds Rejected

The Chanticleers were admitted at the Seattle convention, and their Standard proved to be one that described a distinctive breed. This writer had never been enthusiastic about this variety, but Mr. Robertson, of Canada, who is in touch with the breeders of this new Canadian breed, helped to word a Standard for it that is one of the best that has ever been given to a new breed, giving it a distinctive form and one that provides all that utility requires. Mr. Robertson admitted that the quality of feather in these birds is not good, and that some Wyandotte type prevails, but if the breeders will take this new Standard and "go to it," they will have a worth while breed. Time will tell.

This matter of distinctive type is most important. There is or should be, a limit to this (Continued on page 625)

The Best Growth Is Made on Fresh Ground

By T. S. TOWNSLEY

**Tainted soil makes sickly flocks
—Growing stock especially susceptible—Troubles that arise—
Vegetation necessary to keep the ground sweet.**

THE greatest menace to the poultry industry of America is the possibility of serious epidemics of disease brought about by the weakened condition of fowls caused by soil contamination. Much of the disease which troubles poultry keepers at the present time can be directly traced to lowered vitality caused by the poisonous effects of soil that has become tainted by fowl manure, and as the poultry industry develops the menace of disease is certain to become ever greater unless poultry keepers in general awaken to the threatening danger and take the necessary steps to prevent undue contamination of the soil on which the chickens live and pick their food.

The recent census report shows a fowl population of approximately one bird per acre in the most important poultry states, and these figures would indicate that there ought to be but small danger from soil contamination if the birds were properly handled with regard to this problem. However, anyone familiar with poultry keeping conditions must recognize that the fowls make use of but a very small portion of the enormous acreage in great agricultural states such as Illinois, Iowa and Missouri; and although the statistics show that there is an average of approximately one acre for each fowl kept in these states, soil contamination in the poultry yard is already a serious handicap to profits with a considerable number of flock owners.

Dr. A. J. Durant, veterinarian in charge of poultry diseases, Missouri College of Agriculture, reports that a very large per cent of the fowls sent to him for post mortem examination are infected with intestinal parasites, which shows that they have been raised on soil that was contaminated by the influence of other birds. He states that quite a lot of the mortality among adult fowls is caused by the direct influence of tape worms, round worms and other intestinal parasites that are gotten through soil contamination, and that without question the weakened condition of the fowls affected with worms paves the way for a considerable per cent of the roup and other diseases so commonly reported.

Not Only In Back Yards

The worst cases of soil contamination might logically be expected to be found in back yard flocks and in other flocks confined to a small area, but close observers report that the unsanitary condition of the soil in the poultry yards on many large farms cannot be exceeded by any back lot poultry raiser no matter how careless he may be. In spite of the fact that general farms of 100 or more acres commonly keep an average of only about 100 hens, it is by no means uncommon to find that poultry keeping operations on such farms are practically limited to a small plot of from one-fourth to one-half acre near the dwelling house. While in many cases the adult fowls have practically free range of the fields surrounding the homestead, it is quite commonly true that the young chicks are brooded year after year on the same small plot of ground, and the brooding yards are frequently in close proximity to the permanent laying houses where the old hens mingle freely with the growing chicks and keep the soil quite thoroughly impregnated with droppings.

No matter how much range the birds may have the presence of a patch of bare ground around the poultry building is a pretty sure sign of soil that is loaded with poultry filth. As long as grass or other vegetation can be kept growing, the poultry manure will be utilized in plant growth, but whenever the soil becomes bare the droppings from the fowls quickly form a coating over the surface and become mixed with the soil by tramping so that it is wholly unfit for the use of poultry.

The poultry keeper who has a limited amount of land commonly recognizes the dangers of soil impurities and either sweeps or scrapes off the coatings of manure or else carefully cultivates the land to assist in keeping it sweet, but many farm poultry keepers are so occupied with other duties

that they either do not recognize the dangers of soil contamination about the poultry houses and in the brooding yards or else they do not have time to correct the condition.

The effect of a soil poisoned by the excrement of other fowls is quickly apparent on young chicks and results in slow growth, uneven development, unthrifty condition, and a high rate of mortality. While the effect is not so readily noticeable on mature birds, the hens that range over tainted ground soon lose the brilliant color of their feathers and develop a sickly, unthrifty appearance. It is the nature of chickens, particularly of the growing stock, to pick up considerable quantities of earth, and those that have access only to soil loaded with poultry droppings are slowly but surely poisoned.

Grow Young Stock on Fresh Ground

Frank Hanley, a Brown Leghorn breeder of O'Fallon, Mo., had an experience last year which convinced him of the value of providing fresh uncontaminated range for the growing stock. He had been using as a brooder house for several years a small building near the main laying house and the range provided for the young chicks was a part of the lot ordinarily used by the mature hens. His first hatch last year was handled in this house and he suffered considerable loss from various chick diseases and the chicks that were saved were slow growing and exceedingly unequal in development.

By the time a later hatch had come off, Mr. Hanley had built a movable colony brooder house and had located it in the edge of a wood lot only a short distance away from the poultry yard but separated from it by a chicken-tight fence. The range around this house was fresh virgin soil, and the thrift of the chicks brooded under these conditions in comparison with the earlier hatched chicks brooded on the contaminated lot was quite remarkable. The mortality among the chicks on the fresh soil was practically zero and at six weeks of age these chicks were larger than those in the other lot were at nine weeks and the chicks on the fresh range were healthy and uniform in size and vigor in comparison with the scrawny, uneven bunch raised in the old brooding lot.

It is a well known fact that chickens raised on a new place do better than those that range over land which has been used by many previous generations of fowls, and this difference can be accounted for only by the evil effects of soil contamination on the vigor of the birds. The history of many poultry plants is that the first few years are exceedingly profitable because the chicks are easy to raise and the mature stock is highly productive, while with succeeding years the profits show a diminishing return due to the increased difficulty of raising the chicks and the decreased production of the laying stock due to decreased vitality. This condition is brought about by the weakening influence of soil that becomes tainted by the impurities thrown off by the fowls.

The best method of preventing soil contamination is to rotate the poultry crop just the same as other farm crops are rotated and use the land for poultry only part of the time. The Maine Experiment Station reports a rotation of chickens, a hoed crop such as beets, cabbage, mangels or corn, timothy and clover. Some such rotation as this will keep the soil comparatively clean and enable the poultry keeper to stay in business for a long period of years on the same plot of ground.

Under farm conditions the laying flock should be given free range during the whole season except a short time during the winter months, and the permanent laying houses should be so located that the fields surrounding them will be used in some good farm crop rotation, such as corn, oats, wheat and clover, with the chickens having free range over as much of the land as they may need at all times except when they might damage crops that are just coming out of the ground or for a brief period (Continued on page 614)

Poultry Meat Production Should Be Developed

THE farmer and the poultry raiser always scratches his head in a more or less complex manner when thinking about the fact that half of the chicks he has hatched are going to develop into cockerels, and only half of them will develop into laying pullets. These surplus males have always been somewhat of a problem. Our European, and particularly our English, friends have been in the habit of thinking of their poultry industry in terms of poultry meat rather than in terms of eggs, as has been our custom. At least in America the poultry raisers as a great group have been less interested in developing that side of their business than in building up efficient egg producers. But times are changing, and conditions within the poultry industry are changing also.

The writer recently had an opportunity of visiting a section of that little coast state of New Jersey, centered in Burlington County, an area of farming country that has developed many lines of agriculture, and of seeing on farm after farm flocks of big black hens, Jersey Black Giants. That region claims the distinction of having originated those fowls, and it is an honorable achievement, for the Giants are fast coming into their own. But be that as it may, those farmers, not unlike countless thousands of farmers throughout the country, are carrying along flocks of these black fowls, perhaps one or two hundred, not more, as a rule, along with other major lines of farm effort.

They have been gradually developing these black fowls through the years as birds that suited their especial purpose, and that purpose has been mainly to breed a type of fowl that would caponize fairly well, but that would be economical and efficient in egg production. Those farmers have been much interested in the possibilities of producing poultry meat at a profit, and they or their wives have been successful in many ways. They have no particular conditions which make possible better or great results in their section than are possible in any other section. And therefore a bit of their customs and practice might not only be of interest but of great value to any poultry raiser interested in breeding and growing any of the bigger, heavier types of fowls. And many of our egg farmers are putting in a few heavies as a side line, and they are glad to admit it. The writer has been surprised to note this wave of enthusiastic support of poultry meat production.

More Interest In Poultry Meat

Basing my arguments on the conversations and observations noted on that little trip as well as upon countless letters written on the subject, there appear to be several very good reasons why there is a turning of poultry public interest toward the meat values of hens and cockerels.

In the first place, there is a possible way to handle the surplus males that accrue on every poultry plant in order to dispose of them at a profit. Of course, such work must be carefully planned and carried out. In many instances in the past the surplus males have been a sort of necessary evil, as it were. Especially in those breeds in which the males may be developed to carcasses carrying good flesh,

By W. C. THOMPSON

Interest in the dual-purpose breeds increasing—Market of the cockerels as roasters or capons—Caponize early in the season—Range is desirable.

that is the heavier types, the males may be made even the most important part of the spring hatch, overshadowing the females in matter of profit. In other words the development of this side of the poultry business on a profit-making foundation is possible. It is being done in many places. At least it is safe to say that it can be practiced much more extensively than it has been.

Secondly, the growing of finished roasters and capons will supply a valuable and necessary contribution to the human diet. Of course, lots of people eat chicken now, but the public appetite for finished roasters and capons can and should be further whetted.

Thirdly, there are many poultry flocks that can be made greater profit makers by developing the economical production of finished roasters and capons.

Fourthly, those breeds in which roaster and capon production are possible furnish hens the carcasses of which after finishing the laying period, may be made into good meat in fairly good quantity.

Fifthly, the raising of poultry meat, which includes broilers, roasters, capons and fowls, helps to balance up the year for the poultryman. It aids him in managing so as to secure some income during each month. The main market for roasters and capons falls at a time when he needs more income than his table eggs are bringing in.

Essentials to Economical Production

In glancing about and studying a bit as to the probable essentials to the successful and profitable production of roasters and capons, the following points stand out as strikingly true:

First, the right kind of fowls must be raised. It is

not so much a matter of breed or variety as it is a matter of strain or family within either. The poultry meat producer should strive to get a line of fowls that possess certain characteristics, such as early and rapid maturity (comparatively, of course), economical use of range and food, efficient in fat and flesh formation during the finishing period, strong and vigorous as to health, popular in demand, and agreeable and satisfactory to work with. For those farmers visited down in Burlington county, N. J., the Jersey Black Giant fills the requirements. In other parts of the same state, R. I. Reds predominate, and in still others Barred Plymouth Rocks, White Rocks, Wyandottes, Orpingtons, and others are popular. The good old Light Brahma is still a long ways from being forgotten.

Second, whatever fowls are being raised the chicks must be hatched early in the season. One probable reason why some farmers have not secured as profitable results as they might have from their capons is to be found in too late hatching. Any rather large fowl should be hatched early, that is in March, probably, for most localities. A month's early start will do much toward securing bigger profits in the following winter.

Third, hatch the chicks from which roasters and capons are to be raised as near the same time as may be possible. This will work for uniformity and evenness in the flock, make feeding easier and more efficient, and make possible a neater, finer market product later on. (Continued on page 614)

The good size and substance of the dual-purpose breeds gives them a table value as well as an egg value.

Barred Rock Hen Lays 324 Eggs In Year

THAT modest appearing, business-like, Barred Plymouth Rock hen shown in the picture, was bred at the Oregon Experiment station. In making her record at the University of California farm bureau egg laying contest that closed Dec., 1921, she went about the business of laying an egg 324 times in one year. That is, she stopped to rest only 41 days during the year.

Perhaps she didn't consider it work to lay 30 pounds of eggs but to the onlookers the feat, like all great achievements, seemed to cost a great amount of effort on her part. The fact that her toenails—those animated poultry rakes—were worn off to mere stubs at the end of the contest is conclusive proof that genius, as usual, was well mixed with hard labor.

This remarkable bird is the result of the work in poultry breeding conducted at the Oregon Agricultural College by Professor James Dryden. During the last 10 years he has been at work developing pedigree-egg bred birds. A little over a year ago a pen of 10 Barred Rocks was entered in the California contest. This particular individual known then as merely "K-24," was one of the ten.

She didn't get off to a flying start, but after once getting started six eggs were laid in succession—something unusual for a pullet just beginning to lay. From that time on she never did stop laying for more than one day at a time, and an average of 28 eggs a month was made until molting time. Her record for the three months that include the molting period was 24, 23, and 25 eggs for September, October, and November, respectively. Most hens do not do that well even in the spring when, as it is said, "anything with feathers will lay."

An Egg-bred Pedigree.

"This record is not a freak occurrence but is the result of breeding from the best for years," says A. G. Lunn, acting

interest and expectation."

The hens entered in the California contest were kept under model conditions, yet the average cost of food for each hen was only \$2.50 a year, while the 324 eggs produced by the champion were worth \$12.15 at 45c a dozen. During the year this hen consumed 40 pounds of dry mash, 40 pounds of grain, 3 pounds of shell, and 7 pounds of grit. Kale and barley greens were the winter green feed

head of the poultry department of the Oregon Station. "Our 324 egg hen is a granddaughter of a hen that laid 303 eggs her first year. She is also closely related to a 308 egg hen, and her pedigree is full of individuals that have averaged well above 200 eggs a year. We have mated her to a male with high producing ancestors, and look forward to her progeny with

The official tally card. 324 eggs—count 'em.

With a record of 324 eggs in one year

charcoal, 20 lbs.; medium charcoal, 10 lbs.; salt, 4 lbs.

This mash was kept before them at all times except in a few instances when the fowls consumed too much.

Eight years ago the Oregon station startled the poultry world by producing a hen with an official record of 303 eggs in one year. A little later the first hen to lay a total of 1,000 eggs in a life time completed a record there with a total of 1,188 eggs. Since then a hen of the station flocks laid 1,300 eggs during her lifetime. This shows the actual possibilities of high producing hens that combine longevity and stamina.

These long distance records are really more significant of the work accomplished than first year records. It is this phrase of breeding that has been given most emphasis at the station.

One notable result was a pen of 20 Barred Rock hens, products of years of selective breeding for high fecundity. These hens were trap-nested for six years. The average production for each hen the first year was 235 eggs. A gradual decrease then occurred until, during the fifth year, they averaged 163 eggs each. Even their record for the sixth year, 107 eggs each, was well above the average production of all hens in the United States.

These figures indicate what could be expected in increased production and longer living flocks if poultrymen in general would practice selection and breeding of "best to best." The average poultryman cannot trap-nest his flock the entire year, but it has been found that trap nest records taken for the best two months—March and April—give a fairly accurate estimate of a hen's laying capacity. It is important (Continued on page 615)

Beginners Luck Not Equal to Perseverance

THE difficulties which arise in the pathway to successful poultry keeping are no greater than the obstacles along the way toward any worth while objective point. While difficulties will materialize most unexpectedly at times, many of them are avoidable and are encountered in proportion to one's attention (or lack of it) to all the details about the poultry plant.

The degree of success attending the poultry venture will be somewhat in proportion to the perseverance of the poultryman. The person of variable temperament whose spirits rise to sunny heights and fall to chilly depths is much like the incubator subjected to great variation of temperature.

When the damper keeps a-bobbing it is decidedly unwise to count the unhatched chicks. But for all that, an incubator under such unfavorable conditions may produce a good hatch and the high-and-low temperature man may likewise do surprisingly well with the chickens if he is as persevering as the incubator.

The first leg of the journey up the pathway to poultry keeping is smooth going. With good stock and proper rations it is a comparatively easy matter to gather the high priced winter eggs. The pathway becomes more broken and rocky as the poultry man to-be arrives at his first year of breeding and hatching. Bad hatches may be the first indication of bad breeding, just as blisters on the feet are evidence that the road has been getting somewhat stoney.

When the difficulties arise the back copies of the favorite poultry journal are taken down from the shelf and a cover to cover search is made for light on the perplexing subject, hastily skimmed over when the issues were fresh from the press, but now given close attention.

Each step of the way should be carefully considered. One should not skip steps going up for fear of a disastrous stumble. The persevering ones will now doctor the blisters and proceed a little more cautiously on the way toward poultrydom and in due time will arrive at the desired destination.

The difficulties of the poultryman are like the rats attracted to the poultry plant. When the young rats are allowed to grow, multiply and undermine the premises, they consume the feed and young chicks and germinate disease.

Just so will the little difficulties develop into big ones, undermine the bright prospects and consume the profits unless the poultryman keeps perseveringly after 'em. Perseverance of the aggressive sort like the pup in the cartoon, pursues the "pests" and puts the profit in poultry keeping. A rat-trap sort of perseverance may sometimes serve the purpose, but we like best the up-and-at-'em kind.

When the eggs fail to hatch well perhaps the breeding stock hasn't been properly handled or the fault may be located in the incubator—at any rate get the answer.—"Sic 'em 'Perse.'"

The growing pullets may not mature as they should. Are their mothers to blame or is the fault yours? "Bite 'em 'Perse.'"

If the laying stock has the roup, the litter may be damp or the ventilation wrong. "Shake 'em up 'Perse.'"

Maybe the mighty mite has reduced the egg record. "Eat

By C. E. ASHBROOK

Difficulties are like rats—Get after them aggressively—Enthusiasm and discouragement are like the variable temperature of an incubator—Keep the regulator working.

"They're laying fine" "We had a bad hatch."

'em up 'Perse.'"

How Do You Feed?

Having provided the properly balanced dry mash and scratch grains, the succulent feed, the grit, oyster shell and charcoal and the water, there is sometimes a tendency to shift much of the burden of further responsibility to the hens; but the observing poultryman, knowing something of her temperament, knows too that how to feed is quite as important as what to feed.

They go hand in glove, so to speak. In many little ways the hen may be induced to increase the consumption of raw material (feed) with a proportionate advance in the output of the finished product (eggs).

The ideal egg factory runs to capacity, with no part time, no shut down and with no overtime to wear out the hen machines.

Some little hints on feeding are here offered from the winter's experience; just little things that help to keep the egg record off the downward trend.

The other day a friend of ours built and put in his laying house a labor saving mash hopper; a hopper that held two hundred pounds of dry mash and required filling only now and then.

"Isn't she a 'beaut!'" insinuated our friend. "I call her 'Big Bin' after a well known alarm clock. She gets 'em up in the morning and they come a hustling for a place at that hopper."

"There's an alarm to it all right," we agreed, "but you'll find that attached to your egg record. Your big labor saving contrivance will serve about five hens. The more aggressive ones will fill up while the rest of the flock kills time and air their grievances on the side.

"You'll have a bunch of ill-tempered hens and they won't lay as well as formerly.

"The important thing is not how much you can get into a mash hopper, but how much mash you can get into the hens.

"So use 'Big Bin' for a storage bin and make some little round hoppers; keep them filled with fresh mash from your 'Big Bin.'"

We make the hoppers of lard cans. Cut them down to about six or eight inches in depth and turn over the sharp edge. Cut a piece of two-inch poultry netting to fit in loosely to keep the hens from scratching out the mash. A wire across the top holds in the netting.

Set the hoppers up off the floor on a wide shelf and they will not fill up with flying litter as they will if hung within reach of the fowls from the scratch floor.

Any of the various types of hoppers that provide about two inches of feeding space per hen are all right, but we like best the little round hopper.

The hens gather around it just like the family gathers around the dining table. A little table pushed against the wall, with some eating and some waiting would not be

a very popular dinner arrangement. The family soon would be hustling for preferential place just like the neighbors hens that feed at the "Big Bin."

We always thought the natural grouches sought the little wall tables in the restaurants but now we know 'twas the wall tables helped to make 'em grouchy and dispeptic.

To lay well, the flock must be contented and happy; whatever adds to the contentment of the (Continued on page 616)

Means of Providing Summer Shade for Poultry

POULTRY confined in runs in blistering hot summer weather suffer severely, fail to thrive, and drop off in egg production unless adequate shade of some sort is provided. This unprofitable state of affairs can readily be avoided or eliminated by a little thought and well-rewarded work on the part of the owner. Shade of some kind, either natural or artificial, is imperative if hens are to be profitably maintained at their maximum egg production and if growing chicks are to escape a severe setback or even worse as the direct result of lack of available shade. Here's why:

Reasons Why Poultry Requires Shade.

Authorities tell us that our present-day breeds of chickens originated from wild fowls found in equatorial regions having a torrid climate, sweltering sunlight and days and nights of almost equal length the year around. Therefore, we might reasonably expect that our poultry should be well able to stand extremely hot weather without discomfort or damage, but such is not the case. The truth of the matter is that domesticated chickens, as we know them, do suffer severely. Domestication under the radically different conditions of the north temperature zone apparently having cost them much of their original hardiness and "asbestor" qualities which were possessed by their wild ancestors. At any rate we know that scorching heat and summer sun together have a highly harmful effect upon the general health of poultry, and that certain serious disorders often follow prolonged exposure. No doubt the fact that fowls alone, of all domesticated farm animals, do not have sweat glands in their skin explains the condition at least in part, for their only provision for maintaining normal body temperature is by panting. The hard worked farm horse can perspire freely, thus cooling off quickly when necessary, but who has never noticed hens as they stood panting furiously in the scant shade of a fence post, wings slightly raised and beaks opened, sides heaving with each quick-drawn gasp? Such a condition as this cannot help but result in impaired vigor and lessened usefulness of the flock with an accompanying shrinkage in the monetary returns. Nor is that all:

Failure to provide shade will soon manifest itself in the poor condition of small chicks, and ducks and geese are especially liable to suffer from the ill effects of overheating. Young chicks, though they require a relatively high temperature while brooding, will be seriously affected if the heat becomes too great or if direct sunlight is not kept off. Good shade protects from heat and sun while permitting proper ventilation, an essential of profitable and successful poultry raising. Another point to be kept in mind is the great need of shade during the period of the summer molt. Fancy fowls, and particularly the colored varieties, must be well protected from the strong rays of the sun during and just after the molt when the

By J. H. H. ALEXANDER

Shade from rapid and prolific growing plants and vines.—Sunflowers.—Castor beans for dense shade.—The beautiful ornamental varieties

new feathers are just out. If this is not done the colors are liable to fade, a fault that will never be overlooked by the successful and experienced breeder and exhibitor of show fowls—nor by the poultry judge. But how can the necessary shade be supplied?

Plan for summer shade in early spring while there is still time to take the necessary steps, for eleventh hour attempts to provide shade usually meet with only indifferent success. Frequently on the average farm we find that the matter of shade for poultry receives but little thought, and still we seldom hear of injury resulting directly from intense heat when the flock is handled according to the common farm plan. Why is this true? Usually because on the general farm there is ample natural shade, and poultry running at large—as they usually are permitted to do—are free to seek shelter from the sun under shade trees and bushes during the hottest part of the day. As a nursery for young chickens the farmer's wife, who generally serves as foster mother of the feathered flock on the ordinary farm, chooses the orchard as the place for brooders

and colony houses. For this purpose the orchard is ideal. It serves as a protection from high winds and storms, supplies shade in abundance, and should be utilized wherever possible.

Looked at from a slightly different angle, a combination of fruit and poultry farming is a paying proposition that is gaining rapidly in popularity. Poultry raising with fruit raising as a side line permits the double

utilization of land, so to speak, to the mutual benefit of chickens and trees, the former contributing valuable fertilizer and the latter giving welcome shade. To those contemplating going into poultry raising on an extensive scale, one of the wisest possible moves is to plant trees, unless there are plenty already on the land, and fruit trees have a decided preference over others because they will serve a double purpose.

In this discussion we will concern ourselves entirely with emergency shade for poultry, and the means of providing it. The subject naturally falls under the two heads of (1) artificial shade obtained by the use of buildings, shelter roofs, or wooden or cloth sunshades; and (2) natural shade supplied by rapid growing, broad-leaf plants and annual or perennial vines that quickly produce dense shade over a large area. It is difficult to imagine conditions under which it would not be possible to provide shade of one or the other sort if the owner takes the matter in hand in time.

Artificial Shades and Shelters.

Where there are no trees to supply natural shade it stands to reason that some sort of "make-shift" shade must be provided if best results are to be expected from the flock. This can be done in several ways. For instance, colony houses or brood coops built with a board floor may be raised far enough above ground (Continued on page 609)

A flock of Light Brahmas enjoying a shaded retreat. Low bushes are more enjoyed than the shade of higher trees.

Editorial

Chickens and Vegetation

WITHIN recent months there have appeared in the Journal articles written by Harry G. Forster, author of the Y. M. C. A. poultry course, and Willard C. Thompson, professor of poultry husbandry at the New Jersey Agricultural College, on the importance of adequate land for poultry farming and the dangers of soil contamination. This month, T. S. Townsley, who is continually traveling the length and breadth of the state of Missouri as extension poultryman for the Missouri College of Agriculture, presents an article of the importance of fresh ground, particularly for growing stock.

Mr. Townsley's article, like those that preceded it, is a study of nature.

We are learning, slowly, costly, painfully, that we cannot successfully organize poultry operations against nature.

Nature made the little chick's feet to run on the ground, and if we insist on keeping the chick removed from the ground, its wings begin to droop, bowel trouble starts, its legs weaken, and at last death ensues.

Nature destined birds, including fowls, to possess the air, and if we insist on confining them in a close coop, without proper ventilation, growth slackens, colds develop and an epidemic of trouble follows.

Nature made the earth green with plant life, the plants feeding on the soil and air, and then she inhabited the ground with animals that feed on the plants. She intended that there should be a balance plant life and animal life. If we disregard the principle of balance, and taking a little piece of earth, crop it continuously to plants, it finally wears out, so that our crops starve and die. Or if we take the same little space of earth and crop it continuously to animals, including poultry, the manurial contamination taints the ground so that our poultry crop likewise fails.

The great epidemic that ravaged the once prosperous Londerzeel poultry district in Belgium, sprang from too great an intensification of poultry on the land. The accumulation of adverse circumstances over a series of years at last broke forth like accumulated waters, from back and behind, washing out a dam. Bacteriologists working with microscopes and staining glasses at Louvain University concluded that their work was useless until the growers of Maline chickens in and around Londerzeel stopped undertaking to grow 10,000 chickens on an acre of land.

Such intensification is not attempted in United States. But observing and analytical Townsley points out that there is an intensification in many back lots and on many farms that accounts for much of the annual loss amongst growing chickens.

A few years ago we were called to a farm, many miles out in the country, where it had become impossible to grow chickens. The loss of chicks had been 800 that year. The chicks were being started on the same ground on which chickens had been grown for forty years. That piece of ground laid between four or five big trees which served as outposts, and with the addition of smaller sticks driven into the ground, supported some 2 foot small mesh fence, which served to form an enclosure. The ground was barren of grass or other plant life. The few remaining chicks were droopy. We examined several. Light patches were on the liver. The owner thought that we should prescribe a nostrum that the druggist in town could supply for a quarter. Our recommendation was disappointing. We advised: "Tear down the five dollars worth of fence, get your chicks out of the old run and grow them on fresh ground."

Nature never pollutes the ground, or the waters, or the air. Man is the fellow who works havoc, and the less he

knows of the course of nature, the more he disregards her ways. At best we do not know much of nature, standing only ankle deep in knowledge, but no poultryman who has daily to deal with problems that arise from natural sources should stand dry shod.

Spring Time Once Again

Chas. A. Phipps, proprietor of Homestead Campine Farm, forgot his beautiful birds long enough to read the current news of the day, and then he wrote us in this wise:

"Why do you not write an editorial on the signs of the times; on the mismanagement of almost every walk of life; of every industry, including practically almost every thought of the human mind? The failure to enact good, reasonable, useful and sensible laws and the overwhelming enactment of useless, senseless and destructive laws; the unbalanced idea of paternalism in business, together with politics; the want of a true, honest and intelligent leader to help the President restore confidence, business and prosperity,—fair and good profit for labor, the farmer and the manufacturer. All should pull together for the heaviest production possible for the pay, at the least cost, so that the poor old consumer can get a lot out of life in his endless pursuit of happiness. Make the punishment fit the crime and God in his mercy will forgive us all."

The world is full of unrest. In one of the great cities of this country there is an average of one murder a day, one suicide each day, and nearly two deaths a day from motor propelled vehicles. Bad conditions are commonly blamed to "the war." But before the war, in the last century, there was injustice and guilt. Wm. Cullen Bryant, great American poet, who lived 1794 to 1878, wrote:

"Friend, if thou hast learned a truth which needs no school of long experience, that the world is full of guilt and misery, and hast seen enough of all its sorrows, crimes, and cares to tire thee of it, enter this wild wood and view the haunts of nature."

Nature has ever been to man that good nurse that knits up the raveled sleeve of care. The solution of half our troubles is to get away from the crushing, machine industry of modern life, and get out where the rains fall upon the fields, the warm sun shines, and spring unlocks the arteries of life and nature blossoms forth.

Here we are upon the crust of the earth. It is the part we know and come in contact with. In its relation to the whole, solid globe, it is thinner than the skin of the thinnest skinned apple.

Like dust upon a table the fertile soil lies upon this surface. It has been formed by innumerable changes throughout immeasurable ages, in which rocks have become cracked, and washed, and pulverized, and humus has been added as a result of decayed plant growth.

The seed germinates within this soil. It sends up its little shoot toward the sun, and its feeble root into the ground. The little hairs on that root, rarely seen, for when a plant with its root is pulled, they are left in the ground, being so delicate that if touched they collapse,—those hair roots absorb water and plant food from the soil.

The soil water passes up into the main roots, then into the stem of the plant, and finally reaches the leaves, where under the influence of sunlight, the food in the soil water is united with food taken in by the leaves from the air.

Plants breathe. There are numerous, very small pores on the under sides of the leaves. An apple leaf has a hundred thousand of these breathing pores to each square inch. Through these pores the outdoor air enters the leaves.

Stimulated to perform its function by the energy received from the sun's rays, the leaf takes simple compounds from the air and simple compounds brought up by the sap water from the roots, and builds them into more complex compounds. These are transferred to all parts of the plants,

causing the growth of more and larger leaves, more and larger roots, a bigger stem, and at last the seed.

From this plant food the bodies of animals are built. Animals, including poultry, live on plants and the grain which plants produce. This plant food serves as a source of motive power, the hen generating energy from the supply of energy stored in the plant. The hen develops the heat of her body, and maintains its temperature no matter how cold it may be, from the energy of the sun's rays which was stored in the plant. The chick grows and develops, and its bones, flesh and feathers are formed from the plant food it eats, combined with the water it drinks and the oxygen it breathes from the air. Plant products sustain animal life.

The poultryman and stock grower takes five pounds of plant products and converts it into one pound of chicken or animal. When we eat that meat, we enjoy the benefit of thousands upon thousands of years of soil making, of the energy of the sun in promoting plant growth, of the utility of poultry in transforming that plant food into the more highly nutritious and condensed form of poultry meat and eggs.

Poultry meat and eggs are efficient foods. The consumer of these products gets his energy in a condensed and easily assimilated form of meat food. First, the plants that are now turning green will labor for him for six months and produce a crop of grass and grain; then his poultry grows and fattens for six months on that plant food; then he utilizes the essence of all that program.

Nature has wonderfully provided for man. It is no longer necessary for him to live in a hostile world, seeking refuge in a gloomy cavern, like primitive man, ruled by ignorance, haunted by hate and fear and greed, with his only reliance, a club with a stone on the end. There are places where the sun shines, and the plants grow, and chicks peep through their shells.

Of course, the tax assessor will find you. There is no way to escape being a citizen. We can only try to get some of the sweet out of life, and try a little to make the world a mite better for having lived in it.

Feeding or Breeding, Which?

The egg is the result of the living tissues of the hen taking up the food nutrients that she takes into her system and converting them into yolk, albumen, shell membrane and shell. The good feeder provides a ration that is so balanced that the hen has as little difficulty as possible in making these different substances which form the complete egg.

Egg production depends on the hereditary constitution of the hen, which is governed by selection of parent stock, and comes under the head of breeding.

Egg production is also dependent upon the chief agents in the metabolic process, the intestines, liver, gizzard, blood, and all the inside mechanism, colloquially called "innards." The more intestinal development, the larger the inside organs, in proportion to the frame and muscle of the bird, the more capacity she has for egg production.

Given this capacity, with hereditary constitution, egg production becomes solely a matter of feeding and management.

Which is more important, the breeding or the feeding?

At the International Egg Laying Contest, Storrs, Connecticut, for the month of March, 1922, the 100 contest pens of 10 hens each laid and ate as follows:

	Mash	Grain	Total Feed	Eggs per pen
Plymouth Rocks	40.6	49.1	89.7	208
Rhode Island Reds	40.8	46.7	87.5	202
Wyandottes	34.8	44.9	79.7	188
Leghorns	36.8	40.7	77.5	186

Thus it appears that egg production was in direct ratio to the amount of feed consumed by those hens.

In the "Record of Performance for Poultry," established by the Canadian Government, it appears from the report for the past year, that of the 7511 birds entered by breeders,

30 per cent qualified for official certificates of performance, by laying not less than 150 eggs in 52 weeks, compared to 17 per cent that qualified the preceding year. That large increase in efficiency of one year over the preceding year must have been due to feeding, selection and management. It could hardly have been due to the slower process of breeding.

Unquestionably too many rash claims are being made for superiority of ability to breed for egg production. Enthusiastic new breeders may assume that they have laid down the judging stick by which the breeds were built in the long years of the past, to pick up the magic wand of utility selection, but let them remember that breeding is a subject to live with. Is not what they are accomplishing due more to feeding and management, which can be duplicated by anyone working under similar conditions?

The old breeders never went off on a tangent from the normal cycle of egg production, and paid fabulous prices for phenomenally high layers. Such birds have been appearing in flocks for years. Back in 1848, a Mr. Philips is reported to have had a Cochin China which laid 120 eggs in 125 days. There is no record of said gentleman having made history as a constructive breeder.

Many poultrymen are satisfied with fair egg production, and some breeders go so far as to grain-feed their hens so as to conserve their energy for the breeding season. Their customers often report records of production that are most excellent. Those records are plainly the result of feeding.

The influence of feed is illustrated by the naturalist who studied the recurrent vole plagues in Northern England and Southern Scotland. In the last of these plagues, 1890-92, the common field vole multiplied to such an extent as to threaten the farmers of Northern England with ruin. The most powerful agency in the suppression of these rodents proved to be short-eared Owls. Under the stimulus of this increased food supply, these owls developed remarkable fecundity. Normally laying 4 to 8 eggs, clutches of 13 eggs appeared, and instead of producing one small clutch of eggs a year, the owls laid two of the big clutches.

Another thing about wild birds. The number of eggs laid ranges from 1 to 20, according to the species; one in the case of the Guillemot, twenty in the case of the common Partridge. If these eggs are removed or destroyed, more are laid to take their place, and this replacement of eggs may be repeated many times during the season, until the maternal instinct is gratified or the bird becomes exhausted.

In domestic hens we have an every day application of these two conditions. First, an abundant food supply. Second, the systematic robbing of the mother hen's nest. This last point is not theory. When Professor Patterson was in charge of the Missouri Poultry Station, one of his experiments demonstrated that even a nest egg exerted an influence in promoting broodiness, which is always followed by a cessation of egg production.

Let us not in our ignorance and conceit pat ourselves on the back as breeders, forgetting the influences of feed and management.

Two years ago we purchased a hen at the New York state fair. She laid not more than 30 eggs last year. At this writing she has laid two eggs so far this year. We raised a pullet from her last season that is one of the best layers we ever owned, with a remarkably large, soft abdomen. That pullet was fed for growth and development. She developed large internal capacity for the consumption and assimilation of quantities of feed. Of course, her sire transmitted a constitutional trait of large capacity, and then feed developed it.

Feed has a marvelous influence on the species. The Gallus Bankiva, said to be the single wild type from which all breeds have descended, wandered forth in the deep recesses of the jungle to find such food as the primitive forests provided. Then man came to be the master of the species.

Did early man, limited in knowledge of heredity, recast that original type into domestic fowls of greater usefulness,

A Bright Eye

A BRIGHT EYE, sturdy legs, lots of life, distinguish the baby chicks from Sheppard's "Famous" Ancona Farms. One pleased customer says: "They are bright as a dollar."

Usually "Famous" chicks are waiting and eager to hop out of their shipping box at their destination—the minute the box is opened.

I am so certain that your order of baby chicks will arrive in good condition that I prepay the postal charges on all original orders for baby chicks of one dozen or more, and guarantee them to reach you at least 95 per cent alive. The particulars regarding this offer are in my catalog—mailed on request.

Buy "Famous" Hatching Eggs Now

When you set Sheppard's "Famous" Ancona eggs you are minimizing your own chances to lose. Eggs you buy from me not only are guaranteed to be fertile, but I give you my word they are gathered from thoroughbred stock, many of them prize winners at the world's greatest poultry show, Madison Square Garden, New York.

There is no better time to order your hatching eggs than right now.

H. CECIL SHEPPARD

BOX 525

BEREA, OHIO

President, International Ancona Club

by controlling its hereditary tendencies, or by feed and management?

He has failed utterly to recast the constitutional hereditary tendencies of pheasants. He cannot domesticate them and become the controlling factor in their inheritance by selecting each pheasant that shows special capacity for growth, or size, or fecundity. They do not yield to a grateful master because their organisms do not respond to improved conditions of food and shelter.

The stealth, muscle, and power of flight in the jungle chicken cock has given way to the docility, soft flesh, and contentment of the domestic American and English breeds; the capacity of the wild bankiva female to lay a clutch of eggs and reproduce her own kind has been expanded to where she opens the fountain springs of life and produces egg food in great excess of the actual needs of reproduction. The bodily organism of the species has yielded to improved methods of feeding and management.

More power to the instructors who are preaching better housing and balanced rations! More sales to the makers of mash feeds! To them belongs a large part of the credit for the uniformly good production that even beginners are today obtaining.

Poultrymen who have culled out healthy hens of small capacity from grain fed flocks have been astounded at the response in terms of eggs that those hens have made when put on feed that contained an animal protein supplement in the form of milk or meat.

If eggs alone are your desideratum, then breed only from healthy stock and specialize in a study of feeding and management. If breed quality and beautiful plumage is to be added to your flock, then your studies will be more extensive and the field of personal enjoyment and satisfaction will be broader. You will be more in the reflection of the Creator who made the shapely and attractive wild birds of North America, which, in addition to their beauty, serve the practical purpose of fighting worms and insects, working for and with mankind.

A Good Buff Leghorn.

Dean E. Roberts, Wisconsin, writes:

"As you were interested last season in the photograph of my Buff Leghorn cock bird Brother Bob, I am sending you herewith a photo of a cockerel, 1921 vintage, out of my 1921 pen that was headed by Brother Bob. This cockerel won 1st at the State Buff Leghorn meet at the Milwaukee National Show last November in strong competition.

"I have read with interest your comments on the birds at many of the principal shows for several seasons and having had the privilege of looking over most of these shows myself, I have grown to have a whole lot of confidence in your opinions about a Standard bird. Therefore it has occurred to me that it would be interesting to have a cut of this Buff Leghorn cockerel published alongside of the best White Leghorn picture you have—a picture not finished off by an artist's brush, and then have your comments on how many laps you think the Buff breeders are behind in type."

We thank Mr. Roberts for sending the picture. We appreciate his interest. We are pleased to comply with his request by presenting herewith his 1st prize S. C. Buff Leghorn cockerel at the Milwaukee show and the 1st prize

YOU can depend upon the law of heredity. That being the case you are as certain to secure thoroughbred prize winning, egg laying stock when you purchase from Sheppard's "Famous" baby chicks or hatching eggs as you are certain that the sun will rise tomorrow morning. Sheppard's strain of "Famous" Anconas have established a world-wide reputation as winners.

Winners at Madison Square Garden

For fourteen consecutive years Sheppard's "Famous" Anconas have swept the boards in their class at Madison Square Garden, New York. My customers win with "Famous" Stock. One writes me: "Have shown your strain of Anconas at seventeen shows and with one exception have always won the 'blue' and 9 large silver cups."

They Win In Egg Laying Contests

Not only are "Famous" Anconas handsome show-birds but they hustle for their "keep." They are heavy winter layers of large white eggs. This may not apply to the general Ancona family—but it does to Sheppard's "Famous" Anconas.

One customer writes: "My utility flock of 40 pullets laid during the month of February, 435 eggs and there was not a day during February that the thermometer registered above 20 below zero and about 10 days out of the month it was 40 below zero."

The accumulated experience, the inbred quality, the splendid records collected during the past fifteen years are back of every tiny "Famous" baby chick and every single hatching egg shipped. This year why not order hatching eggs or baby chicks from Ancona Headquarters? If you haven't my catalog—send for it—if you have, order from it.

BOX 525

BEREA, OHIO

President, International Ancona Club

S. C. White Leghorn cockerel at the last New York show.

Comparisons are often ill taken, and critical comments often make enemies of friends, however, Mr. Roberts is good enough sportsman to ask for both comparison and comment.

To begin with, the White Leghorn cockerel nicely portrays the new Leg-

Good type of Standard exhibition Single Comb Buff Leghorn cockerel.

horn type as approved by the Standard Committee for the 1923 Standard. How does the Buff cockerel compare with it?—Exceedingly well, and shows that progressive western, as well as eastern breeders, are producing the modern bird.

If we could make the Buff cockerel to order, we would give him a little more length of feather. The Standard says: "Hackle abundant, flowing well over shoulders." The hackle on this cockerel is a trifle short. With more length of feather he would have a little longer and fuller saddle.

How would you go about it to produce this feathering? By studying and selecting the females. We would select a female that has long, broad individual feathers in her neck and cushion of back, and this abundance of feather properties would be the basis for plumage development in her male progeny. In addition to longer and fuller hackles and saddles, her cockerels would begin to show an extra pair of lesser sickles, which would add grace to their tails.

Good type of Standard exhibition Single Comb White Leghorn cockerel.

Regal Dorcas Eggs

HALF PRICE

"Lady Jane"—Record 262 eggs in eleven months, American Egg Laying Contest, 1919.

More Regal Dorcas Prize-Winning Cockerels are hatched in May than in any other month of the year.

"WHY?" Because these Regal Dorcas White Wyandotte cockerels are so vigorous, so thrifty, and make such remarkable growth that many of them are fully matured in six months.

At the National White Wyandotte Club Meet at Kansas

City, Thanksgiving Week, 1920, I showed twelve cockerels in the Single Class and three in the Young Pen Class, all of my own breeding. Five of these cockerels were hatched in March and April, ten of them in May.

As the season is so advanced, I have decided to reduce egg prices earlier than usual. You can now get eggs from the same identical birds that produced these marvelous prize winners last season, for half price.

After May 8th, Egg prices will be as follows:—

PENS 1 to 10: (Exhibition Matings)

\$5.00 per 15; \$15.00 per 50; \$25.00 per 100.

PENS 11 to 20:

\$3.00 per 15; \$9.00 per 50; \$17.00 per 100.

PENS 21 to 40: (Dorcas)

\$2.50 per 15; \$7.50 per 50; \$13.50 per 100.

PENS 25 to 32: (Special Dorcas)

\$5.00 per 15; \$15.00 per 50; \$25.00 per 100.

ALL STAR MATINGS: \$10.00 and \$12.50 per 15.

UTILITY MATINGS: (as they run) \$10.00 per 100.

All eggs guaranteed 75 per cent or over strongly fertilized. These remarkably low prices will make a very heavy demand for the balance of the season. Rush your order direct from this ad, and produce some of America's Finest White Wyandottes.

Half Price Sale

Eggs after May 5 half price

For a small amount of money you now have the opportunity to buy eggs from the finest exhibition matings in America. The very same from which we raised our sweepstakes winners for the Coliseum show, Chicago, 1921, as well as egg laying contest winners. Prices now are:

15 Eggs	\$ 7.50
30 Eggs	13.75
50 Eggs	22.50
100 Eggs	40.00

Eggs from all other matings reduced accordingly. Chicks at a very liberal discount after June first. Mating list free.

HILLVIEW FARM
Box 4004 Benld, Illinois

Official egg records: 257, 243, 263, 217, 251, 249, 202, 230, 243, 240, 246, 266, 221, 233, 203, 238

First Cock, Chicago Coliseum Show, Dec., 1921.

After the Buff cockerel received this kind of feathering, he would appear cobbier than in the present state of his feathering, just as the White cockerel, if he had skimpy feathering, would appear lanky, long and raw. The Buff breeder could then add to the length of his cockerel by breeding longer bodied females.

For many years Buff Leghorn males were low in station. The bird illustrated herewith is a distinct advance from the old squatty type. His comb shows refinement over the birds of a few years back. His tail carriage, together with filling in front of tail, is a sample of the splendid quality to be found in the variety today.

The Buff Leghorn variety is not finished. If it were there would be no incentive for breeders, nothing for them to study, nothing for them to look for or aspire to. If any variety should ever reach that point where all its specimens should absolutely meet an uncompromising rule of absolute perfection, enthusiasm would wane, and then all the points so arduously attained would deteriorate. It is the joy of overcoming, the satisfaction of mastery, the reward of victory that leads the breeder on in his study and his work.

When he has done the best he could, it is discouraging for someone of prominence to say that his ideals are aesthetic and not practical and that a bird that shows less refinement in breeder is more useful.

Controverting such a statement, P. D. Larrimore, White Leghorn breeder of Georgia, states in a recent booklet he has published: "Never sacrifice Standard quality for production; they should go hand in hand, and a breeder who is incapable of keeping up the quality of his strain will not be able to keep up the producing ability of his strain for any great length of time."

The Tariff.

The permanent tariff bill was at last reported to the Senate, April 11th. The rates that apply to agriculture are "designated to give to agriculture the same protection that is given to industry and are the highest rates of duty ever imposed."

The dutiable list includes the following:

Par. 711. Bird, live: Poultry, 3 cents per pound; all other, valued at \$5 or less each, 50 cents each; valued at more than \$5 each, 20 per centum ad valorem.

Par. 712. Birds, dead, dressed or undressed: Poultry, 6 cents per pound; all other, 8 cents per pound; all the foregoing, prepared or preserved in any manner and not specially provided for, 35 per centum ad valorem.

Par. 713. Eggs of poultry, in the shell, 8 cents per dozen; whole eggs, egg yolk, and egg albumen, frozen or otherwise prepared or preserved, and not specially provided for, 6 cents per pound; dried whole eggs, dried egg yolk, and dried egg albumen, 18 cents per pound.

The free list includes the following:

Par. 1507. Any animal imported by a citizen of the United States specially for breeding purposes, except black or silver foxes, shall be admitted free, whether intended to be used by the importer himself or for sale for such purposes: Provided, that no such animal shall be admitted free unless pure bred of a recognized breed and duly registered in a book of record recognized by the Secretary of Agriculture for that breed: Provided further, that the certificate

Green Sheen Strain Silver Campines

May is the month for hatching

The natural breeding season is here. Campines that are hatched in May and early June will make the finest show birds and winter layers. Remember the Campine grows faster than the Leghorn.

\$7.50 per sitting; which is 25% discount. Three sittings, \$20.00

Instead of waiting until June to cut prices, as has been the usual custom among breeders for many years, I am giving you a 25% discount this month, in the heart of the hatching season. My pens contain all of my great Chicago Coliseum winners, and you will receive excellent value for the money you send me.

My birds were again champions at the Chicago show last December for the tenth consecutive year.

I have the largest plant devoted to the raising of exhibition and high record Silver Campines in the United States. My birds have been inbred on my farm over a series of years, housed in open front houses, and are fully acclimated, hardy and vigorous. I have had 89 males placed under ribbons at the Coliseum Show in the last ten years. During the same period, I have had 160 females placed under ribbons. This record is without equal in the history of the great Chicago show. It is a part of Campine history. Some good cockerels at \$5.00 each.

Mating list free. Your absolute satisfaction is guaranteed.

As we MADE all of the Orpingtons, it is natural we know how to MATE for the best results and our customers derive the benefit of this knowledge and are sure of the best and purest blood from us as well as the best layers. An Orpington of our strain holds the world's official record by laying 339 eggs in twelve months. We have won over fifteen thousand first prizes. We keep Buff, White, Black, Diamond Jubilee and Blue Orpingtons, all of which we MADE. Several thousand stock birds for sale. Write full requirements for special quotation. SEND for price list today. SATISFACTION guaranteed and backed by a reputation of 49 years. Advice free.

Double-Development Guaranteed

THERE'S nothing mysterious about Purina-fed chicks growing twice as fast as chicks fed grains or other unbalanced diets. Most rations contain too much grain—too much carbohydrates or fat and heat-making elements—too little protein for muscles, feathers, nerves and vital organs. Ordinary rations also have too little bone-making materials.

Purina Chows

supply ALL the chick-building elements. That is why we can guarantee that *Purina Chicken Chowder* and *Purina Baby Chick Chow* will make baby chicks grow twice as fast during the first six weeks as when fed grain feeds, or your money will be refunded.

For Better Profits

Feed Purina Chows—the best is the most profitable. With it you will raise more and better chicks from your hatches. More of your pullets will lay the first winter. You will get more eggs through the moult. Your hens will be put in condition for heavy egg production during the winter. Call up the nearest Purina Dealer at once or write us.

of such record and pedigree of such animal shall be produced and submitted to the Department of Agriculture, duly authenticated by the proper custodian of such book of record, together with an affidavit of the owner, agent, or importer that the animal imported is the identical animal described in said certificate of record and pedigree. The Secretary of Agriculture may prescribe such regulations as may be required for determining the purity of breeding and the identity of such animal: And, provided further, that the collectors of customs shall require a certificate from the Department of Agriculture stating that such animal is pure bred of a recognized breed and duly registered in a book of record recognized by the Secretary of Agriculture for that breed.

The Secretary of the Treasury may prescribe such additional regulations as may be required for the strict enforcement of this provision.

Par. 1508. Animals brought into the United States temporarily for a period not exceeding six months, for the purpose of breeding, exhibition, or competition for prizes offered by any agricultural, polo, or racing association; but a bond shall be given in accordance with regulations prescribed by the Secretary of the Treasury.

Par. 1564. Eggs of birds, fish and insects (except roe for food purposes): Provided, that the importation of wild birds is prohibited, except eggs of game birds imported for propagating purposes under regulations prescribed by the Secretary of Agriculture, and specimens imported for scientific collections.

Par. 1632 a. Pigeons, fancy and racing.

Extensive provisions are made for the administration of the tariff. Exporters shall be required to declare on their invoice the purchase price of each item in the currency of the purchase, and any other facts deemed necessary to a proper appraisement, and both the exporter's and importer's books shall be subject to the examination of inspectors of the U. S. Government.

Inasmuch as Canada breeds to the American Standard, it is to be regretted that Standardbred poultry from Canada is not to be received on the same reciprocal basis as fancy pigeons.

The protection on Chinese eggs is the minimum requirement.

In parts of China the population is so great that man has come into competition with animals. There is not enough plant food to sustain both, so animals have had to go. Each acre of land must support six human beings. They live directly on plant food, such as rice, and export their eggs. The United States could not compete with the Orient and needed protection on Chinese eggs. Oriental eggs are produced by scavenger hens feeding on the lowest forms of food.

It Was Ever Thus.

D. Lincoln Orr, past president as well as former secretary of the American Poultry Association, sends us some old clippings from the American Poultry Journal. We reprint below two of them. The first is from an old Journal when the 1898 edition of the Standard was under discussion, telling what a joke book that Standard of Perfection would really prove to be. It was headed, "Some Standard Absurdities," and was as follows:

"In Poultrydom, the ridiculously named Standard of Perfection is the code. There can be no standard of perfection of anything else that is based upon indefinite ideas and changed with every passing whim of those who make the rule.

"It would be more consistent if the American Poultry Association were to christen this book of the law 'A Struggle Towards a Fix-

ity of Ideals, with a View to Some Day Reaching Something Which Can Be Called Perfection."

The fact is, a Standard is impracticable, for the reason that there is no singleness of ideal in the minds of judges and fanciers. The book we call 'Standard of Perfection' is a collection of arbitrary opinions held by a majority of a very small committee; while the great mass of breeders hold a variety of different opinions.

"Besides, this book with a high-sounding title is a typical weather-cock, turning under the influence of every passing breath.

"The mission of American Poultry Association is not to make a Standard, but to create a wider influence for the good of the poultry industry. Its promulgation of a code is only an incident—although an essential one in the work undertaken by its members. The association is, indeed, the germ in the egg. It is the evidence of fertility in the undeveloped body politic of the fraternity. No one can tell exactly what sort of bird will issue every five years; and as surely as the lustrum rolls around, so surely will we see men trying to straighten the crooked back and twisted tail of the chick Standard. Some even try to pull the disqualifying feathers, and put the infant on its feet in the great show room. But no Standard has been—perhaps none ever will be—issued that is worthy of its name.

"Still, imperfect as it is, this book has a purpose, and serves a beneficial end. In spite of the handicapping conditions, it is accepted as the best result of commendable effort. Fanciers are fanciers because they fancy their own ideals. They wouldn't be true fanciers if they accepted other men's notions.

"It is this warfare of opinions which keeps alive the interest in competitive displays. If shows were to be done away with, the higher concern in poultry would soon die out. Men must fight for their ideals.

"But in this contest, as in the building of a code, there should be a recognition of one fundamental point, namely, the admission that Nature knows a little something about fowls. The real object of the Standard of Perfection should be not the demonstration of how varied and defiant of Nature a bird can be made to become, but rather how perfect the natural proclivities can be shown.

"That is to say, 'in Adam's fall we sinned all,' and the birds we see are but parodies on Nature's original. Man has neglected the feathered race. He seeks to reform it. So, instead of getting correct information as to what Nature desired to do he grows 'artistic' and tries to make the bird after man's own notions.

"As to Brown Leghorns, the burden is heavy. The new proposed disqualifications are: 'Shanks other than yellow, white in the face of cockerels or pullets'; this latter clause admits this defect comes with age. An early hatched pullet of 1898, perhaps the best of the year, is to be swept aside by one of inferior quality, the only cause being a defect of maturity. Of the many thousand Brown Leghorns produced each year, how few we see, even in the show room, that could not be punished for lack of color in legs. How consistent, 'Shanks other than yellow' turns down a Brown Leghorn to which nature would allot legs of another color. Blacks have but little more chance, while yellows have the advantage over them all. Far better to disqualify for lack of size and breed characteristics in all varieties rather than place a premium on adeptness at finding a shade of gray in any part of plumage."

Times haven't changed much. Twenty-five years ago, it was being said that the new Standard was wrong, the disqualifications were wrong, the Standard Committee was arbitrary, and the Brown Leghorns were being ruined. One would think that the date was 1922 instead of a quarter century ago, for are not the same criticisms heard today?

Through it all the purebred poultry business has grown, expanding and prospering more and more as the years

Down Go The Prices of Baby Chicks!

Only a few chicks left for shipment up to May 15th, @

25 chicks -	30c each
50 " -	29c "
100 " -	28c "
1000 " -	27c "

These are our wonderful **GRADE A** chicks, the kind that has made **LORD FARMS** famous. Uniform stock, early maturing, extra good size, laying extra

large eggs. Orders are very heavy this year; for May and June chicks we urge you to place your order immediately.

AFTER MAY 15th Genuine Lord Farms Grade A Chicks Will Be Only 20 Cents Each

This is the perfect time to get our strain of Leghorns. They mature in 4½ to 6 months, and will make splendid winter layers.

25 chicks @	22c each
50 " @	21c "
100 " @	20c "

rolled by. The reason is that after the smoke of controversy clears, it is found that the Standard is a pretty good old book after all, worthy of acceptance as a code by both judges and breeders.

The second clipping taken from those sent by Mr. Orr, conveys the attitude of the public after a revision is over and the controversial issues have been finally settled. It is from the American Poultry Journal of March, 1904, and reads as follows:

"After it is now all over the members of the American Poultry Association and all other fanciers so vitally interested in the work can surely congratulate themselves on the new Standard, which has been evolved from the hard work and many perplexities of its Revision Committee. We believe a Standard has now been accepted that should be a pride to every breeder and the A. P. A. No changes have been made of so radical a nature as to disturb existing conditions, and the many improvements and additions will serve to build a still stronger foundation for an enduring prosperity."

May we not trust history to repeat itself and again give us a Standard that will "build a still stronger foundation for an enduring prosperity?"

Busy Summer Ahead.

A meeting was held in Philadelphia, April 10th, with the following in attendance: D. Lincoln Orr, Sec'y. of the New York and Washington shows; R. O. Lipton, Sec'y. Newark show; H. S. Thompson, Sec'y. Baltimore show; and H. W. Britton, Sec'y. Philadelphia show. An organization was formed to be known as the "Allied Poultry Show Secretaries of America."

The meeting voiced its approval of Single and Rose Comb Rhode Island Whites, Black Giants and Rose Comb Barred Plymouth Rocks. The secretaries of specialty clubs representing these four varieties, as well as secretaries of all other specialty clubs wishing to have their varieties listed in a new Standard, are requested to submit their breed standards to H. W. Britton, Sec'y. of the Allied Poultry Show Secretaries of America, Moorestown, N. J.

It is proposed to place these Standards in a new copyright book which is to be known as "The Ideal Chicken, by the Associated Poultry Breeders of America, the Standard for Judging."

Thus a new organization appears upon the horizon.

While this was happening in the east, Thos. F. Rigg, President of the American Poultry Association, sent out a clarion call as follows:

"During the next twelve months several questions of vital importance to the very existence of the American Poultry Association must be met and settled. I believe in preserving the integrity of the American Poultry Association as an organization for and by the fanciers and breeders of Standard-bred fowls."

There is no mistaking that declaration of an American Poultry Association for the breeders of Standardbred poultry. It now rests with Mr. Rigg and the breeders who elected him to rededicate the A. P. A. to the principles of its early founders. That will mean harmony.

Tom Rigg has laughingly said: "The A. P. A. is saved once a year. Each August the life-saving crew goes to the convention to save the old ship."

This time, however, instead of nail-

JOHN G. POORMAN
Box 100 Tinley Park, Ill.

ing on a few extra planks, setting a few sails at cross purposes and fighting for a place in the pilot house, the old boat is to be stripped down to her hull and rebuilt. At least such is the intention of the following resolution to be presented at the Knoxville meeting:

"We, the undersigned members of the American Poultry Association, request the appointment, by the President, of a Committee of five to revise the Constitution and By-laws of this association. The intent is a general constitutional revision.

H. P. Schwab
E. C. Branch.
Geo. Robertson
Theodore Hewes
Walter Burton
Frank L. Platt
A. C. Smith
A. A. Yoder
D. E. Hale
John H. Robinson."

As you probably suspect, no two of the above signatories perfectly agree on how to make the ship sea worthy and at the same time equalize its carrying capacity to its cost of operation. That is why they chose to delegate to the president the honor of naming a committee that should provide a plan by which the millennium could be ushered in.

We will let you in on a secret. There are more holes in the present constitution than in a Swiss cheese, and the dollars run out faster than the sands in an hour-glass. Of course it would not be democratic to say it, but privately the feeling is growing that a close central control should be delegated to the real poultry breeders of America.

The adoption by the Knoxville Convention of the resolution authorizing the President to appoint a constitutional revision committee, the purpose being a general revision of the constitution, would place in Mr. Rigg's hands the absolute power to remake the A. P. A. It would grant to him the opportunity to hand-pick five men who could write a constitution for a breeder's organization. We believe that he would use that power wisely and well, not without great criticism of course, but not without great benefit to the pure-bred industry.

Co-operative Egg Marketing.

Some may say that the business of the producer is to produce, and maintain that the shipper is not a producer, that he is a distributor, and has no relation to production. That is like saying that the boy who delivers the evening paper is not a producer. While the last, not the first, he is as much a producer of that paper as the man who made the newsprint, or the ink maker, or the editor, or the printer who set the type, or the pressman who fed the sheets, for as far as the consumer of news is concerned that paper is not produced until it is placed in his hands.

There is no moral or business reason why producers should not ship their own eggs to market if they can do so successfully and advantageously. No advantage is to be gained in some sections. The marketing machinery is efficiently organized and economically operated. This seems to be true in the northern half of Illinois.

In the southern counties of the state, except in the St. Louis district, it appears that buyers take the attitude that the eggs are in the country and must be

WHITE DIARRHEA

Don't Let it Kill Your Chicks. Remove the Cause. Stop the Infection. Save them now—Act Quick.

Here is a sure guaranteed treatment for this contagious germ disease that kills more chicks than all other diseases combined. Don't lose a single chick this year. Raise every one you hatch. Keep them healthy and strong and growing fast. Get after the cause of White Diarrhea. Then your battle is easily won.

"Diles"

"POULTRY-TONE"

is a safe and effective preventive and treatment for all bowel germ diseases. It combats the germs that cause white diarrhea and it tones up the system so the chicks can resist disease.

"Diles" **POULTRY-TONE** positively prevents White Diarrhea. For Chicks already affected, it affords prompt and permanent relief.

Money Back Trial Offer

We want every reader of this paper to try Poultry-Tone without any risk. Simply send your name and address. Send no money, unless you wish. Say whether you want 50c size for average flock or \$2.50 size which is ten times larger. Pay the postman (plus few cents postage) on arrival. If it doesn't do everything you expect it to do, you will owe us nothing. Your money refunded on request. Send today sure.

Keep Your Chicks Alive

Others are doing it, so can you. Don't let the chicks die like drowned rats with White Diarrhea and other diseases—give them WACKER'S CHICK TABLETS in the water from the start, then you'll see them grow. Others will wonder how you do it.

Better Than Green Food

Just dissolve WACKER'S B. T. G. F. Tablets in the drinking water, you get better results, larger eggs and better production; ask any one that uses them. No meat then needed. Try Wacker's Roup Tablets, they will not fail you. WACKER'S TABLETS MUST PRODUCE RESULTS OR YOUR MONEY BACK. C. O. D. orders promptly filled. All tablets, 600 for \$1; 1300 for \$2.

Wacker Remedy Co., Box 157-2, Camden, N. J.

sold. Accordingly they are disposed to buy on a low cost basis.

E. F. Murphy, head of the poultry and egg division of the Illinois Agricultural Association, has made a careful survey of this situation, and after a year of preparation has opened eleven co-operative egg marketing depots in low price districts of the state.

The result has been that local buyers have immediately put up their paying prices for eggs. Advances of 3 to 8 cents a dozen have been reported.

Mr. Murphy is able to equip a receiving station for about \$85. This includes 100 cases and fillers, and all incidentals ready for shipping. The money is secured by a \$3 membership fee from each farmer-shipper.

The eggs are bought on a quality basis. That is the point on which country buyers have erred. They have done nothing to encourage the producer of more and better eggs, by recognizing quality and paying a remunerative price for same.

Mr. Murphy found in the beginning that his stations received 10% of dirties, cracks and checks. His latest report, in spite of prevailing wet weather necessitating more litter in houses and nests, shows that the dirties, checks and cracks are now down to 7%.

The poultry shipping season has not arrived, but on a sample shipment of ten coops in April, he netted \$60.03 over paying prices of local poultry buyers. When this news got around, local prices went up from 18 to 21 cents a lb.

Just as it is said to be "good business" for the man who buys to buy as cheap as he can, so it is "good business" for the man who sells to sell for all he can get. Co-operative egg and poultry marketing is here, has an excuse for being in existence, and whether it is to sweep the low-price districts like a prairie fire rests with those local buyers who are quoting prices.

The future of co-operative marketing also rests with those who are supposed to know what co-operation means. Co-operative enterprises do not develop financial strength. Their surpluses are divided and are never accumulated. This means the co-operators who draw their dividends in fair weather must stick in gloomy weather. That is the meaning, the demand of co-operation.

Another thing. Co-operative movements do not develop strong merchants. They develop branch managers. The co-operators themselves must assume the responsibility of leadership. They must know what co-operation means. Do people really know?

Mr. Murphy is shipping his eggs to the Chicago market. He figures 1 1/4 cents per dozen for cases, flats, fillers and pads. Expense of carriage to Chicago is about 2c per dozen by express, 1 cent by freight.

He requires no farmer to agree to deliver all his eggs to the co-operative stations for a period of three or five years. He knows that his competition may, and has, put up local prices, but he believes that only service will make for permanency, and whenever the organized machinery of buyers can do the job more efficiently and economically than he can, he is willing to be succeeded by them. That is fair enough.

The Illinois Agricultural Association, which employs Mr. Murphy, is a state organization of country farm bureaus, and is the state unit of the American Farm Bureau Federation.

YES! Egg Prices did take an awful tumble

Which spoiled a lot of people's plans. However, with over 33 years experience in the up and downs of the business we can see no serious reason for alarm. You know poultry and egg prices have more than held their own throughout the readjustment stage.

Sure, they went too low, which is proven by the fact that they are already climbing back up. We need such experiences as these, however, to eliminate the fickle ones from the industry. It gives the progressive fellow a chance to move forward.

There is no wiser saying in any business, than the time to start in or to expand is when the other fellows are discouraged and going out. Just as potatoes as a rule go into the ground cheap and come out dear, so with eggs at hatching time.

We plan on raising the largest number of birds we ever raised. We did this several times when eggs were extremely low in the spring, and found the country facing a shortage in the fall and breeders willing to pay us good prices.

PARKS' STRAIN BRED-TO-LAY AND-DO-LAY Barred Plymouth Rock Customers

Make their real money from their Winter Egg Yields. That's the time of the year—there's no argument about the price. Our ROCKS are the most popular layers today. They are more extensively bred and advertised than any other strain, and there's a reason. They have simply layed their way into universal popularity. Having made and hold about all the world's Rock Laying Records.

EGGS—CHICKS

Prompt shipment, safe delivery guaranteed. 16-page circular sent FREE.

May and June after all are conceded to be the most practical months for hatching and rearing.

The weather is then settled. Nature has provided plenty of green food and bugs, and chicks can be out on the ground from the start, and birds started and brought up under such conditions quite often surpass the older lots. Our Rocks as a rule come into laying maturity at 5 to 6 1/2 months, and are especially adapted to late hatching.

BREEDING STOCK—After May 20th we will start breaking up our breeding pens; at the time we will sell some of our best birds at one-third less than list prices. Birds that we could have sold dozens of times at attractive prices earlier in the season.

16 Page Circular FREE.

CHICKS

as you want them to be

CERTAINLY you would like to see every one of the little chicks you've taken so much trouble to hatch, live and develop into healthy productive birds; see the whole brood grow into a flock of splendidly developed, profitable chickens, which you would be proud of.

Poultrymen all over the country write us that every **H-O STEAM-COOKED CHICK FEED** fed hatch is a "Banner Hatch."

H-O STEAM-COOKED CHICK FEED
Saves the Lives of Baby Chicks

contains the proper proportions of muscle, energy, bone, heat, blood and feather producing elements needed by the little chicks. The grains are cut to pin-point fineness and steam-cooked. This process so prepares **H-O STEAM-COOKED CHICK FEED** that it is readily digestible.

Chicks are not subject to Bowel Trouble, White Diarrhea and kindred ailments. They can digest this feed easily and get the nourishment they need; they grow and develop in record time.

Your chicks too, will live and develop into the finest chickens you have ever had if you will feed them **H-O STEAM-COOKED CHICK FEED**.

It is now packed in the handy five-pound packages obtainable at your local grocer's; or get a supply from your feed dealer.

Sample of this wonder feed and literature, free on request.

CURRENT NOTES AND COMMENT

1922 and 1912.

A friend on the car the other morning remarked on the possibility of the poultry business declining with the decline in market egg prices.

Today a gentleman informed us of a poultry plant that has this spring decided to go out of the business of shipping eggs and chicks, and doing a strictly market egg business "as it is equally as profitable and less bother." The egg market has its attractions for this poultryman.

When anyone talks about the poultry business weakening at this time, we are reminded of ten years ago. In 1912 we made a trip to the egg markets of St. Louis, Kansas City, Chicago, Philadelphia, New York and Boston. Eggs were selling that spring at 18 to 19 cents in St. Louis. When we reached New York we went down to Chambers street and called on Frank Urner, egg statistician and editor of the Produce Review. Mr. Urner ventured the opinion that St. Louis dealers were paying too much for eggs, that 19c meant that they had to go into storage in New York at 22c and such prices might lead to a disastrous season for refrigerator brokers.

Now, here is the point: Those were considered good prices that year, and the poultry papers reflected the general prosperity of the poultry industry. American Poultry Journal for March, 1912, contained 252 pages. Breeders were doing business, and the poultry shows, even more numerous in 1912 than in 1922, had big entries and were well attended. Such was the condition of the purebred industry on a 19 cent egg market in St. Louis and a 22 cent egg market in New York.

No one should expect war-time prices of eggs and grain to have continued indefinitely. It was not necessary that they should.

Utility.

Utility is not new. D. Lincoln Orr sends us a book written by that great old English fancier, John Bailey, which was published in 1852, and from which we quote:

"The Malay fowl, though formerly much fancied and sought after, has of late years been suffered to decline. However unpalatable the truth may be to some who recollect the palmy days of competitions, it must be said, this bird has fallen before the spirit of utility; it was not useful and it has lost ground."

It was ever so. The fit survive. At the present time we know of one breeder of Malays, he living in Buffalo, and breeding stock which descends from a recently imported base. He likes the breed, its cruel expression of head, its height, its distinctive body type. A fancier of this kind gets a little soul expansion out of his birds, a little psychic pleasure and satisfaction, but a race of live stock, including poultry, that is to enjoy widespread popularity must have decidedly utility propensities.

F. W. Kazmeier In New Position.

F. W. Kazmeier who for several years had been poultry husbandman, Texas Agricultural College, has resigned his position to take over the editorial work on the O. K. Poultry Journal, Oklahoma. Mr. Kazmeier will make his home at Bryan, Texas.

Wise Mr. Philips.

At the Purdue University egg show, first week of May, there will be "classes for eggs of any fowl, including freak eggs."

Professor Philips, in charge, knows that exhibitions are never all utility. The public wants to be interested and amused as well as educated. The state boards of agriculture

RADFORD BARRED PLYMOUTH ROCKS

Radford Barred Rocks are the birds that satisfy back lotter, farmer and poultryman alike because they are fine to look at, vigorous, early maturing—layers and meat producers. Radford Farms stupendous win of ten out of twelve Firsts competed for at Milwaukee National November, 1921, proves their wonderful exhibition quality.

have learned this trait of human nature. They may spend thousands of the state's money in educational exhibits at the state fair, but the biggest crowd is always in the midway, where the fakirs are presenting the fat lady, or the snake charmer is to be seen for a dime, or the midgets are dancing.

Professor Philips will find a crowd around the midget eggs, the double shelled eggs, the soft shelled eggs, asking "why are they so?"

* * *

Grow Them All.

The chick rearing season, the best of all the year, is here again.

One back-lotter, who hatched a brood of twelve remarked: "Now if I can grow ten of them." Why not grow twelve of them?

Nature meant them all to be strong. The fewer you grow, the poorer those are that remain, for something was wrong with your methods of handling or feeding.

We know of one breeder who hatches 200 a year. The mortality from hatching day to fall show time is from 4 to 8. That covers the entire flock. It is a record hard to duplicate but it should be the poultry raiser's aim to match it.

It is not necessary to pamper. That does not produce the best results. But proper shelter, green runs, and easily digested food are necessary if the young birds are to develop the strength and vigor to sustain constant growth.

Neglect, poor care or economy in feeding young stock is an expensive mistake. Many well bred birds will sell at a low price, or go to the pot, because they were not well grown.

Bread softened in sweet milk is a good starting food, together with oatmeal flakes. With more size, occasional boiled grain, supplemented with milk of meat scrap, will promote good growth.

* * *

Feather in Barred Rocks.

In producing barred beauties that represent the best modern quality, not only the kind of barring, but the kind of feather is important. Haldie Nicholson who has produced several winners at Boston and New York sends us a feather from the neck of a Barred Rock pullet which is 1 inch wide, also a feather from her back that is 1¼ inch wide. He writes:

"I read your article on the Boston Show, and fully agree with you that the time has come when we have to have broader feathers upon our Barred Rocks, so as to have them mature faster, and eliminate any tendency to weakness. Am enclosing you four feathers from a Barred Rock pullet. I entered her in the Boston Show, not expecting to win, but to simply show some of the Barred Rock breeders the kind of feathers in width we should have upon a Barred Rock. This pullet weighs 7½ pounds, hatched in May and was laying the end of November. The male was a Standard-bred cockerel, female pullet bred."

Feathers in Barred Rocks can be too narrow. The new Standard, as prepared by the Standard Revision Committee, will call for a moderately broad over-lapping feather in both wing flights and main tail; also a moderately broad feather in back of male, for it is felt that if you get the right quality of feather in back, the right quality of feather will follow in breast and other sections.

In many varieties the feather pattern is quite largely dependent upon the size and shape of the individual feathers. This is an important point.

* * *

Slab-Sided Non-Sitters.

The Connecticut Agricultural College sends out a press bulletin telling poultrymen to put a celluloid leg band on every hen that becomes broody, and every time the hen gets broody to put on another band, or to change the color of the band, so at the end of the season he can eliminate the hens that have shown a broody tendency.

The Kentucky Agricultural College sends out a press circular in which it is stated that cull hens should go to market, and that

Eggs all winter

can now be had by any poultryman by coming direct to the source of the great winter egg layers. You are purchasing the progeny of a strain that is 32 years old, thus assuring you that you are obtaining the very best that can had anywhere for the same money. Our prices are extremely low.

SUNNYSIDE EGGS and CHICKS

The parent stock has been line bred and pedigreed and Hogan tested for prepotancy and high egg capacity for the past 32 years. We can supply you with the following varieties.

White, Buff Leghorns; Barred, White Rocks-White Wyandottes; R. I. Reds and White Orping; tons. *The best are the cheapest.*

EGGS PER 100		CHICKS PER 100	
180-200 egg bred	\$10.00	180-200 egg bred	\$25.00
210-248 egg bred	12.00	210-248 egg bred	30.00
240-256 egg bred	15.00	240-256 egg bred	40.00

PULLETS, 5 Months Old, 108-200 egg bred \$2.75; 210-248 egg bred \$3.50; 240-256 egg bred \$4.00. 12 Weeks Old, 180-200 egg bred \$1.75; 210-248 egg bred \$2.00; 240-256 egg bred \$2.25. COCKS, (Same Records), \$5.00, \$10.00, \$15.00. HENS, (Same Records), \$2.75, \$3.50 and \$4.00.

Start now with Eggs, Baby Chicks or Mature Stock that will produce big dividends for you.

Dr. David Roberts Poultry Tablets

A combination of sulphocarbolates of calcium, sodium and zinc for the treatment and prevention of White Diarrhea and all intestinal infections of baby chicks, as well as poultry in all stages of life and productivity. Drinking water for poultry should be medicated to overcome and prevent disease. The annual poultry loss by disease is stupendous—over 50 per cent.

Save Your Chicks

Serve in fresh water. Aids digestion. Permits food to nourish them through their babyhood, the non-productive period when hardy bone and strong muscle is needed to give them a good start in their race for the laying period. They will reward you manyfold later on. Give them proper protection and you will find there is big money in poultry. Sold in tablet form.

50 Tablets 50 Cents

Poultry will drink when too sick to eat. Baby chick organs are peculiarly sensitive. They need something to ward off disease, particularly that most dreaded and destructive disease white diarrhea.

A Tablet A Day

Keeps Disease Away

One package, 50 tablets, enough to medicate 50 gallons of water, a most effective and economical preventive, for only one cent a gallon. Use Dr. David Roberts Poultry Tonic, Louse Powder, Poultry Cholera Medicine, Poultry Roup Paste and Disinfectant, all known and tried prescriptions. Sold by our druggist, dealer, or direct.

Dr. David Roberts Practical Home Veterinarian, a veterinary doctor book, regular price \$1.00, tells you how to treat your own poultry, also describes our 44 prescriptions—a prescription for every animal ailment. We will tell you how to get it FREE.

Our Special Introductory Offer Send 25 cents, just one-half the regular price, for one package Dr. David Roberts Poultry Tablets, sent you postpaid, providing you give us the name of your druggist or dealer.

**DR. DAVID ROBERTS
VETERINARY CO.**
131 Grand St., Waukesha, Wis.

in picking the good layers from the culls it should be observed that "the deeper and more slab-sided the bird feels, the more apt she is to be a heavy layer."

On the one hand we are told that we must not keep hens in which the maternal instinct is developed to the point where they become broody, and on the other hand we are told that we must keep the hens with high breast bones, slab sides and poor fleshing quality.

What are the professors attempting to do,—Leghornize the breeds of this country? Then why bother with the big breeds? Why not simply take the Leghorn with its high breast bone and non-sitting character, and breed more size into its carcass?

The popularity of the American and English breeds is due to their dual-purpose natures. They naturally should have full breasts, not slab-sides, and they should become broody and rear their own young. They are a family fowl, producing eggs, yielding up their carcasses as poultry meat, and giving their owners hen-hatched and hen-brooded chicks.

If you do not like these qualities, breed some other race of chickens, but do not spoil the great dual purpose type.

It is not necessary to recast the dual-purpose type. This writer has three Red Sussex pullets, which are half sisters, each being from the same sire but each out of a different dam. They are in one pen together. They were hatched the first of May, 1921. On December 1, one of them weighed 7½ pounds, being 7 months old. On April 10, 1922, she weighed 8½ pounds. One of the others also weighed 8½ pounds on April 10. The third is about a half pound lighter. If we were called upon to tell according to our best knowledge and belief what their egg production had been from December 1 to April 19, we would affirm that it was approximately 100 eggs per pullet in the 140 days of winter.

Now get this: Those birds are not slab-sided. You can bet on that and win. A good Sussex is never a thin breasted, high breast boned bird any more than is a good standard exhibition Rock, or Wyandotte, or Orpington. These breeds combine flesh and egg qualities together with splendid temperament. It is the height of folly to recast their type.

* * *

The Name of Your County.

The Railway Mail Service has asked shippers to complete the address on all parcels by giving the name of the county as well as that of the town in which the addressee lives, so that there will be no question about the package reaching its destination promptly. In order to carry out this request, buyers should give the seller the name of the county in which they reside.

* * *

Licensed Poultry Judges.

A great deal of criticism has been directed against the policy of the American Poultry Association in granting licenses to judge all Standard breeds of poultry. We recently had the opportunity to talk over with E. C. Branch, head of the judges' licensing committee, the matter of licensed judges.

Considerable good work is being done by this committee, and the policy of examining candidates has been developed to the point where, we believe, that if the same energy that has been expended in criticism in the past is now devoted to improving the system, satisfactory results will be obtained.

The written examination at present is pretty stiff. The applicant is required to write the answers to fifty printed questions. There are no catch questions, but several are extremely difficult, especially when the applicant is asked to state the weights of several of the different breeds. Few judges know all the standard weights. Memory is tricky on little items of this kind, and before cutting a bird for weight the average judge would refer to his standard or tabulated list of weights such as he might carry in the pocket of his duster.

Some of the questions are practical and desirable queries to make of a prospective judge. One question asks how much white should be allowed in the earlobe of a Ply-

mouth Rock before the bird should be disqualified. One applicant for a license, whose examination papers we examined, was unable to answer this question correctly. A man who does not know that any positive enamel white disqualifies specimens of this breed is undeserving of engagements to judge poultry shows. The judge's examination brought out this unfitness. That is good.

Mr. Branch plans to add two features to the examination. He is going to have the examining judge test the applicant for colors. Men who are color-blind have actually applied for licenses, and Mr. Branch has concluded that the number who are unable to differentiate between the gradations of colors is much greater than is generally supposed. Again, the examining judge is to be asked to report on the personal fitness of the candidate. Men may "know chickens" yet not be qualified by temperament and disposition to become successful adjudicators.

The judges committee has devoted much effort to making the examination a good test of the candidates qualifications. Few or those who take it are able to pass. It can already be said that the A. P. A. is granting licenses without the odium of selling them, and that the moral hazard of a lost sale has been eliminated. It is now the aim of the committee to make a judge's license a degree of preferment that will command the respect which should go with a rank of official standing that has been conferred by a diploma after careful examination.

* * *

New Express Rates.

Some time ago the American Railway Express Company gave notice that it would file with the Interstate Commerce Commission a new traffic rate on poultry shipped to and from exhibition rooms and upon Standard-Bred Poultry shipped for breeding purposes.

President Rigg of A. P. A., advises that the only actual change in rates is a reduction giving the rate of one and one-half times the regular first-class rate to fancy poultry shipped in strawboard coops. Under the old or present rate they paid double the first-class rate the same as in cloth covered coops. This is a concession and a reduction in rates.

Other changes in the classifications and rates are entirely by way of more accurate statements of the present regulations under which shippers have been accustomed to get the rate on market poultry for shipment of poultry for exhibition purposes. The only increase in rates is in the form of making rules in regard to declaration of value so strict as to prevent putting a market value on poultry actually having greater value and not intended for market.

* * *

Poultry and Egg Receipts.

Receipts of eggs at the four principal markets of New York, Boston, Philadelphia and Chicago, from Jan. 1 to April 15, 1922, are 4,860,704 cases, which compared to 4,933,800 cases for the same period of 1921.

Receipts of dressed poultry at the same markets for the same period are, 56,655,176 pounds, compared to 52,548,514 pounds for the same period of last year.

Eggs in storage in the United States, April 1, 1922, were 949,000 cases, which compare to 1,926,000 cases on the corresponding date of 1921.

Dressed poultry in storage, April 1, 1922, was 68,480,000 pounds, which compared to 62,315,000 pounds for the same day last year.

* * *

Mr. Rolf's Article.

The article in this issue on the way some birds are being conditioned for showing in utility classes, written by A. F. Rolf, formerly of the U. S. Department of Agriculture, at one time acting head of the Louisiana College of Agriculture, and well known as a Leghorn breeder and Secretary of the National White Leghorn Club, should be read by every reader of the A. P. J.

The poultry business has lived through many crazes. First it was the Cochins China fowl, as big "as a barrel and as tame as a kitten." Then it was that mythical institution, the broiler farm. Then came the little

coop craze by which "60 hens in ten months on a city lot 40 feet square would return \$1,500." It actually paid to spend \$100,000 a year advertising this system.

In addition there was the Indian Runner duck craze. Walter Burton says that craze paid for a farm for him. Then there was Tom Barron and his English White Leghorns which have been reported to have taken \$200,000 out of the United States. Now, we are in the trough of production classes with the waves rolling high. Sailor Rolf, who has weathered past storms, has run up a periscope and tells you what he sees. It is worth reading.

* * *

Guarantees.

A great deal is expected of poultrymen who are sellers and they do a creditable job of discharging the responsibility that is placed on them. Buyers of seeds expect much less. They are willing to take a parcel of seeds from a seedsman with the following understanding:

"That — Company gives no warranty, expressed or implied, as to description, quality, productiveness, or any other matter of any seeds, bulbs, or plants they send out, and they will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms they are at once to be returned."

That release of responsibility is printed on the cartons of one of the largest seed houses in the country.

Considering what sellers of poultry undertake to do as to warranty of the "description, quality and productiveness" of their eggs for hatching, buyers should always be reasonable. Do not expect all the eggs to be laid on "the first of April," so that every order can be promptly filled at that time. And if you are buying baby chicks, remember that the seller is dependent upon fertility and hatchability. With him is not a question of stepping to the sugar barrel, scooping out and weighing two pounds of sugar and passing it over the counter to you. He is dealing with life and reproduction and his most carefully laid plans may go awry.

* * *

Additional Standard Changes.

The Standard Revision Committee remained in session fourteen days, and the following changes were made by the committee after the April issue of the Journal went to press:

Andalusians.

Blue Andalusians. A new standard adopted. Type to express a bird high in shoulders, declining to tail, with elimination of concave cushion in female, slightly more narrow across saddle than shoulders. Color of male to be blue laced in neck hackle and saddle; female to be medium shade of blue in ground color, heavily laced to produce strong contrast. New weights are to be, cock, 7 lbs.; cockerel, 6 lbs.; hen, 5½ lbs.; pullet, 4½ lbs. The birds are to narrow from shoulders to rear.

Scale of Points.

Scale of points. American and Asiatic classes, 2 points taken off comb, reducing its value from 8 to 6. Earlobes remain at 2 for shape of comb not more important than shape on comb goes to new section, wattle shape.

Mediterraneans. Reduced comb to 6, add 2 to shape of legs and toes. This makes shape of comb not more important than shape of back, tail or breast; and more importance is given to the foundation the bird stands on, four points be allotted to leg shape.

English class, comb reduced to 6 points.

Pictures

Albert Angell, Jr., Quaker Oats Co., had moving pictures made of the Revision Committee at work. Twelve reels of films will be made and each reel shown three times a week in the educational films of the Quaker Oats Co., all over the U. S. during the year. Another big move that shows Mr. Angell is not only "on the job" but has breadth of vision and is interested in Standard bred poultry.

Houdans

Houdans to be tipped in same proportion as Mottled Anconas. Edging of white on male tail to be no longer a designated Standard requirement, and illustration in Standard to be altered to conform. Tail of female to be lower a little.

Eggs~now half price!

Here Are Four Big Reasons for Choosing Oak Dale White Leghorns

1. MONEY-MAKERS: Al. Shultz, a boy living in Almstead County, Minn., started with 9 settings of eggs at \$3.50 per 15. He sold \$137.50 worth of surplus stock and made a net profit of \$300.30 on an investment of \$72.20.

Mrs. Edwards, a farmer's wife living in Bottineau County, N. D. with a farm flock of 125 hens, sold \$645 worth of eggs, chicks and stock. Labor and feed cost \$227.87, leaving a net profit of \$417.13.

For economical egg production and beauty the Standard-type White Leghorn is supreme.

2. PRIZE-WINNERS: Supreme at Madison Square Garden is supreme everywhere. At the last Madison Square Garden show, *all 1st, 2nd and 3rd* prizes were won either by customers of Oak Dale, by men breeding the pure Dan Young blood lines, or by men breeding Young and Owen Farm blood combined. The Oak Dale Strain (Young & Owen) is undefeated in the world's greatest shows.

EGGS HALF-PRICE

Under Mr. Lamon's management, every egg shipped from Oak Dale is sold on honor, from the pens you select, newly-laid, fertile. Try Oak Dale's 1922 matings and you will re-order next year. Write today, hatching eggs now half-price.
\$20 eggs now \$10; \$15 eggs now \$7.50; \$10 eggs now \$5; \$7.50 eggs now \$3.75.

Order your Eggs and Chicks now. Take advantage of this half-price offer today. Then next fall when the youngsters are grown-out and are ready for the show pen or trap nest you will delight in the size, wonderful feathering, grand head-points, massive saddles, snow-white color of the cockerels and the symmetrical bodies, sweeping lines, deep pelvic formations and refinement of the pullets. Remember, that the pens which produced them were mated by Lamon, "the master breeder" and that the breeding birds in these pens make up the *Greatest Foundation Flock of Single Comb White Leghorns In the World*—the flock conceded by all to be the greatest winning strain, bar none!

Send for Free Illustrated Mating List

Sit down and write for Free Illustrated Mating List. It means money—more eggs, more silver cups, more blue ribbons. And remember, Mr. Lamon personally guarantees a square deal. Need one say more?

3. EGG-PRODUCERS: In a 365-day test on the Government Breeding Farm, Beltsville, Md., a pen of 30 Standard-type Single Comb White Leghorn pullets produced eggs at a feed cost of 6.7 cents per dozen and made a profit of \$3.41 per pullet over feed cost. It's economical production that counts! Don't be misled by sensational egg records. Remember that during the past six years the 6,000 hens of all breeds in the official Storrs, Connecticut, contest averaged to lay 157 eggs. Don't be buncoed.

PRESS COMMENT

"It has been almost impossible to exaggerate the wonders of Oak Dale Farm at Le Roy, Minn. The great flock on this farm now come under the hand of a master. Harry M. Lamon will not only raise the Standard... but will give prestige and stability to the entire poultry business. Harry M. Lamon we welcome you. There will never be too many like you." O. R. Ernst, Pres. Leghorn World, in April issue.

4. GUARANTEED: Oak Dale Farm is under the direct personal supervision of Harry M. Lamon, who, until March 1st, was Senior Poultryman in the Government poultry work—an arrangement which assures complete satisfaction to every buyer of Oak Dale Leghorns. Every one of the thousands of poultrymen who know Mr. Lamon know that his word is as good as a bond.

CHICKS PRICES REDUCED

Under Mr. Lamon's Management, every chick shipped from Oak Dale will be bred on Oak Dale, from the group you select, strong and husky. Shipped via parcel post or express, guaranteed. Order chicks today; prices reduced.

Chicks from general flock (sired by males worth \$25 to \$50) only 20 cents each.

Buttercups

To go in Continental class as red lobes would not be consistent in Mediterranean class. Weight to be, cock 6 1/2; cockerel 5 1/2; hen 4 1/2; pullet, 4 lb. More than 1 lb. underweight to disqualify. Spangled changes to elongated spots as "spangles" would not conform to definition of this word in glossary.

Pearl Guineas

Admitted to Standard in 1918, but no tentative Standard or historical data was submitted. It was impossible for the committee to recommend a Standard for these fowls for inclusion in the Standard of Perfection.

Turkeys

Recommended that Slate Turkeys be declared obsolete and dropped from the Standard. Narragansett and Bourbon Red Turkey pullets increased two pounds. A new Standard for African Geese. In illustration of Toulouse, head and dewlap to be altered; tail trifle low; keel little short; pictures to show more massive type.

Javas.

Color of Mottled Javas changed from black and white splashing to a black ground color, each feather ending in a white mottle, larger than the Ancona tip, and more like the old Houdan mottle. Such birds are now being bred and shown. The new description will modernize the old Mottled Java and eliminate cross-breeds.

* * *

The Judges' Section.

Walter Burton, Texas, Secretary of the Judges' Section, of the American Poultry Association, writes:

"At the recent meeting of the Revision Committee, there were a number of remarks on the difference of opinion held and applied by different judges. Members of the Standard Committee felt that there should be some plan worked out by which there could be more pronounced uniformity in the awards made by judges; and I have thought it would be a good plan we make arrangements at the Knoxville convention to have assembled an exhibit of birds and then have a general discussion among the judges. Judges are continually traveling over the country and talking with breeders and naturally their ideas should be worth a great deal. I feel certain that if we could adopt some plan by which our awards would be more uniform, or so understood by the exhibitors, it would be a great step forward for the association."

* * *

Suspicion of Judges.

It is always regrettable when dissension is stirred up in the fraternity. There is no easier way to do this than to impeach the motives of judges.

In live stock shows the exhibitors lead their own cattle into the ring. In the Chicago Coliseum poultry show the names of exhibitors are written on their exhibition coops. Both impress us as good practices, designed to remove suspicion, and put the judges on their mettle.

* * *

In the South.

The interest in purebred poultry is increasing in the south, and poultry shows are becoming more numerous. The Keiper Cooping Company announce opening a warehouse at Jacksonville, Fla., in charge of D. C. Stine.

* *

Our Cover.

The bold, wide-standing, full breasted male on the cover this month is a White Laced Red Cornish. The Cornish is an English breed, originated by breeders in Cornwall, England, from the Azeel fowl of India, from which the Cornish derives its type. The White Laced Red variety of the Cornish breed was originated in America by W. H. Card, Connecticut.

Short, narrow feathering is characteristic of the breed, and the birds are heavier than they may appear. Standard weights for White Laced Red Cornish are: Cock, 8 lbs.; cockerel, 7 lbs.; hen, 6 lbs.; and pullet, 5 lbs. These weights are not excessive; and the sturdy fowls, with stout, muscular legs, very broad breast, great width of back, covered with short, firm plumage, are bred to the standard weights without difficulty. There is a tendency in Dark Cornish variety to breed birds very short in leg, but this type does not prevail in the White Laced Reds.

The pair of white, crested fowls on our cover last month were White Polish, a variety not widely bred, yet one of the most practical of all the crested breeds.

Summer Shade for Poultry.

(Continued from page 589)

to permit chickens to find shade and shelter under them. This simple plan is used to advantage by many poultry raisers, works well, and really serves the combined purpose of providing a cool and shady retreat on hot days and protection from sudden summer showers and thunder storms. Since poultry, especially young chickens, are far more likely to run under the coop than into it when seeking shelter from rain, it is important that this space be a few inches above the level of the surrounding ground. If this precaution is taken serious losses which may result from drowning are prevented.

Another form of artificial shade frequently resorted to by poultrymen consists of specially constructed "sunshades," low flat roofs supported by corner posts but not enclosed at the sides. These may be built in a great variety of shapes and sizes, according to the special needs and inclinations of the builder. Likewise they can be constructed of such materials as canvas, muslin, burlap or cheap matched lumber. The latter is preferable to the others, as it is less likely to be damaged by wind, and will afford protection from rain if built with a slope or "pitch" of 1 foot in 8. A useful and inexpensive shelter of this sort may be built 12 feet long, 8 feet wide with the boards running the short way of the roof, and supported by cedar posts set in the ground at each corner. Letting one of the long sides make the front, posts here should be $3\frac{1}{2}$ feet above the ground; in the rear $2\frac{1}{2}$ feet, giving a slope that will shed rain nicely. Avoid building shelters too high above ground; chickens prefer having them low down.

Fast Growing Plants for Shade.

Fowls prefer the shade of growing plants to that of buildings or specially constructed shelters, nor is it impossible to cater to this preference. Trees of course take first place in the list of natural shade producers, but they take years to grow to be large enough to be really useful if they are planted for the purpose. In the meantime other rapid and prolific growing annual plants and vines may be called into service to advantage with every assurance of satisfaction.

Sunflowers are greatly favored, making fine shade for poultry runs and also providing large seed heads that may be hung in the scratching sheds in winter where chickens get much needed exercise by jumping up and picking out the seeds. The usual plan is to plant the sunflowers a yard apart and 18 inches away from fences of chicken runs. A single row will serve but a double row makes denser shade and seems to be the favored custom. Sunflowers may also be used inside the yards, but in this case the young plants must be screened to protect them until well started or they will be scratched out and destroyed. Though the choice of varieties lies between the single flowering and the branching kinds, there seems to be little difference as regards the amount of shade produced. The main consideration is to get a variety that grows rapidly to a height of from 6 to 8 feet and that produces a profuse leaf growth.

Climbing tomatoes, though not frequently used for the purpose, may be made to serve to advantage as border shade around chicken runs where soil and climate are favorable, provided the poultryman is willing to go to the bother of pruning and training the vines. Willingness to do so is amply rewarded by a crop of choice large fruit for market or for home consumption.

Castor bean plants that make a growth of 6 feet or more in a single season are perhaps the best annual plants available for planting outside of poultry fences. The broad, large leaves cast a dense shade and the wide spreading habit of this plant leaves but little to be desired in the way of protection from sunlight and heat, serving the purpose fully as well as a tree which it resembles greatly in habit of growth.

Where both utility and beauty are required, a narrow bed of Caladium (Elephant's Ear) and annual hollyhocks will give a strikingly pretty effect. The former plants grow to a height of 2 or 3 feet under good conditions from well established roots and the mammoth leaves cast a dense shade. The hollyhocks

Best display in both Single and Rose Combs at Boston and Madison Square Garden the same year. My combined exhibit contained 153 birds and 130 of them in the awards. These sensational winnings made not in the small classes, but among the greatest collection of show birds ever exhibited.

Grand Matings for Hatching Eggs

No other matings ever contained such wonderful specimens as mine this year. Not only do they contain my great winners at Boston and Madison Square Garden but the tested breeders that produced them. The same blood lines and as near as possible the same birds that produced these winners last year are mated again this year, making the most reliable breeding combination for the production of show birds and heavy laying stock ever offered to the buying public. Hatching eggs from these grand matings furnish a splendid opportunity to procure this blood at reasonable prices.

ALFRED F. GRAHAM

CAMERON, N. C.

give but little shade, being chosen more for their beautiful blossoms than for their foliage.

There are any number of annual vines that may be called into service where quick growing suitable natural shade is desired. Trained to grow over buildings, along fences or on specially constructed trellises they are very attractive as well as useful. The simplest plan is to plant seed 18 inches outside of the fence, then as the plants grow train them up on wires or strings or laths stuck into the ground and slanted to meet the woven wire fence 3 feet or more above ground. This is necessary, as chickens will quickly peck off every green tendril or runner if vines are planted close to the fence and begin their upward climb in reach of hungry beaks.

Several varieties of beans may be grown against poultry fences, though pole limas and cornfield beans give most shade as well as a food crop always welcome on the farm table. Scarlet runner beans, with their red blossoms, are purely ornamental but desirable where appearance is placed ahead of utility, but as shade producers they serve very well.

As a quick and rank grower, perhaps none of our common climbers compare in popularity or general distribution with the wild cucumber, nor are there vines that can be grown so easily. In fact it may be truthfully said to "grow like a weed" in any kind of soil, and once established will come up each spring from self-seeding. The vines grow amazingly fast, produce a dense shade, and the extent to which they will climb seems to depend entirely upon the height of the trellis or fence. Nobody can go wrong in choosing this vine as a shade producer, and the children find a never ending source of joy in its queer prickly seed pods.

Gourds of a great variety of shapes and sizes of fruit, but all having a desire to "hit the high spots" by climbing to the top of fences or buildings, may be utilized for both shade and ornamentation. A few packets of mixed gourd seeds will hold in store one surprise after another for the grower as they reach the bearing stage and gourds of every conceivable shape take form on the vines. Some are like white or striped eggs, some large and long like baseball bats, some that are calabash pipes in the rough, some are orange and some green and some striped, but all are interesting and useful and a great source of delight to the "kiddies."

Cucumbers, squash and melons must not be overlooked in a discussion of this kind. In addition to their crop producing value they can be made to produce shade, though we have become so accustomed to seeing them growing spread out flat on the ground that we have forgotten that they are really climbers by nature. As an old gardener friend once put it, "They grows flat 'cause they has to, but show 'em a ladder an' up they goes." To specify varieties that can be grown in this way would be unsatisfactory, due to varying conditions of soil and climate in the wide territory occupied by our readers, but it is safe to specify that only those varieties known to make a profuse growth of vines should be planted. Avoid especially the large fruited, dwarf vined melons; they have been carefully developed by selection for growth under field conditions, so will not give satisfaction as shade makers.

Where beauty as well as shade is desired, a choice may be made from a number of flowering vines whose blossoms give a pleasing and colorful effect. Sweet peas do not serve the purpose well as they make an insufficient leaf growth and produce little shade. Nasturtiums are somewhat better, but far from ideal. Morning Glories are an old stand-by that has earned highly deserved favor; they will grow almost anywhere and bloom for a long season. The robust vines attain a length of 30 feet or more, and the luxuriant, dense and varied foliage casts ample shade. Another flowering vine that is not so well known, though it is rapidly gaining in popularity, is the Giant Moonflower. When grown in rich soil in a sunny location and supplied with sufficient moisture while making growth, the vine will reach a length of from 50 to 75 feet in a season. The best varieties produce immense blossoms 7 or 8 inches across in great profusion from July until frost, and the large, densely matted foliage of deep green heart-shaped leaves really places this

Here's More Proof THAT

BASIC FEEDS FOR POULTRY

Do Insure Poultry Success

WILBURTHA POULTRY FARM JERSEY BLACK GIANTS

**Low
Mortality**

Basic Feeds Company, Lockport, Ill.

April 13, 1922.

Gentlemen: I have just finished inspection of our baby chicks and growing stock which numbered today 2723. Six hundred of these are out on range and have been eating No. 452 Basic Growing Mash for over a month and I want to tell you that I have never seen a finer lot of chicks in my life—in fact, this season's hatches have been the best in the history of the farm, which fact I attribute largely to Basic Feeds.

Kindly include three tons of Growing Mash, with car which is to be shipped next week.

Yours truly,

Trenton Junction, N. J.

M. I. CHAPMAN,

THE NATIONAL S. C. WHITE LEGHORN CLUB

**Even
Growth**

Basic Feeds Company, Lockport, Ill.

New Orleans, April 12, 1922.

Gentlemen: The feeding problem has been one of the most serious troubles I have had to solve here in the south. It has given me much worry and trouble in the past, but thanks to Basic Feeds Company, I believe we have found a solution at last.

I am especially pleased with your No. 452 Basic Growing Mash, although your other feeds have given such satisfaction that my White Leghorns are on an exclusive Basic ration.

You may be interested to know that the 1922 mortality list to date, has been less than 4 per cent. This figure isn't based on a small bunch, but applies to the more than 700 chicks hatched to date. I have never seen a bunch of White Leghorns grow as fast as these chicks have this year—ample bone and frame, but free from coarseness and over-development of head points.

Wishing you the success you deserve, I am,

Yours for White Leghorns,

Secretary of the Club

A. F. ROLFE.

WHITE WYANDOTTES

**Perfect
Finish**

Basic Feeds Company, Lockport, Ill.

April 11, 1922.

Gentlemen: The past show season, 1920 and 21, I furnished my White Wyandotte customers scores of first prize winners; first prize males, first prize females, and first prize pens. These prize winners' breakfasts were your No. 502 Developing Wet Mash—in fact, practically all of their feeds were feeds made by you.

Yours truly,

Winamac, Ind.

CHARLES V. KEELER.

Such a group of unqualified endorsements by breeders with reputations such as those mentioned above, is a most instructive sermon pointing a moral of the importance and necessity of Basic Feeds, to such men and breeders as Rolf, Keeler and Chapman. You, too, Mr. Poultryman, can secure the same feeding results as obtained by these Master Breeders. Fill out and mail coupon today. Let us tell you how you can get these same feeding results.

Put Down Cheap Summer Eggs In K. & G. Egg Preservative Now. Have Fresh Eggs To Eat and To Sell All Winter

Don't Sell Your Eggs Now. The price is too low to make you a profit. You can make every cheap summer egg be worth three times as much to you. Cut the high cost of fresh winter eggs. Save every egg now that you possibly can. When eggs are scarce and high next winter, you can get winter prices for summer eggs. Each 50c package of K. & G. Egg Preservative should add \$10.00 to the value of every 25 dozen eggs you preserve. You can never make money faster than that.

K. & G. Egg Preservative Keeps Eggs 100% Perfect

K. & G. Egg Preservative is guaranteed to preserve clean, fresh-laid eggs perfectly for one year. No change whatever takes place. No foul odor, strong or stale taste is imparted to eggs. The eggs can be used for all purposes. The yolks do not break down. The whites will whip perfectly.

The Perfect Egg Preservative

K. & G. Egg Preservative is not liquid glass or any other slimy solution. It comes in powder form; ingredients highly endorsed by U. S. Department of Agriculture. Makes a clear solution, clean, cool, and pleasant to put eggs in or take out. You don't have to use boiled or distilled water. Just take big crock or jar, put in 3 gallons ordinary water, direct from pump or faucet, add one 50c pkg. K. & G. This will preserve 25 dozen eggs. K. & G. is cleanest, most perfect egg preservative in the world.

Read these Testimonials from Satisfied Users

"We used K. & G. Egg Preservative with very satisfying results. We consider it superior to water glass. Eggs preserved are in very fair condition at this time." (Jan. 1, 1922.) J. L. Miller, Comm. Dept. Food & Drugs, State of Indiana, Indianapolis, Ind.

"I invited all my neighbors to see the wonderful results obtained with K. & G. Bought eggs at 15c; put down 56 dozen. Began using when eggs went to 30c. Your K. & G. is wonderful. Don't see how farmers can be without it." John Bitzer, Waco, Texas.

"I sent for a package of K. & G. Egg Preservative last year and tried it out. Every egg was just fine. Used the last egg a short time ago. I know what it can do. Please send me some advertising matter and agent's terms." W. W. Wallen, Farmer's Live Stock Shipping Association, Taylor, Wisconsin.

Order K. & G. Without Delay

No reader of this paper can afford to be without K. & G., for it is the perfect egg preservative. Triple the value of your present egg supply. Preserve them now in K. & G. Egg Preservative. Next fall and winter when eggs are high, you will have plenty to eat and to sell. Big Package, enough to preserve 25 dozen eggs, 50c postpaid. Send your order today for all the K. & G. you need. Free Treatise on Egg Preservation with order.

10,000 Agents Wanted

We want to make K. & G. known everywhere. It's the best help to increase profits the poultryman can get. Everyone who raises chickens for eggs, and for profit, needs K. & G. We want an agent in every county in the United States to help us make our product more widely known. Our proposition to agents is very attractive. If interested, be sure to write at once.

K. & G. Laboratories Company, Inc.
334 E. 51st Street, Chicago, Ill.

remarkable vine in a class by itself as a shade producer.

Still another valuable vine, with star-like flowers and delicate fern-like foliage, is the Cypress vine. When grown to make shade it should be paired with some other climber that makes a more dense leaf growth. This applies also to Allegheny vine (Adlumia) with its pretty rose colored, tube-shaped blossoms and fern-like foliage. Though it grows to a height of 10 to 15 feet, it is better to supplement it with a vine like the Morning Glory or Wild cucumber to assure dense shade. Dutchman's Pipe is also a remarkable grower and a fine shade producer, with large heart-shaped leaves forming a solid background for the oddly pipe-shaped blossoms—that are a constant source of pleasure. Japanese hops is a quick growing climber that attains a height of 20 feet or more in a month from seed, differing from common hops in this respect. The foliage is luxuriant, making a dense covering for trellises or fences, and having the special advantage of being almost immune from insects as well as being highly resistant to drought and extreme heat.

Perennial Vines for Shade.

Hardy vines that survive severe winters have a distinct advantage over the annuals in that they provide shade earlier in the season and that, once well established, they need but little attention. For general purposes, perhaps the best plan is to set out roots or cuttings of perennial vines at points where they can later be trained to climb over walks and driveways, trellises, along fences, or even over permanent buildings where desired. Then, while the hardy vines are getting a start, plant the seed of any one of the several quick growing annuals nearby to make shade during the ensuing season. In this way the perennials, in one year or in two years at most, will be far enough to give all the shade that is needed.

Perennial vines fall naturally into two classes; (1) those that lose only their leaves in late fall and (2) those that die down to the ground, then grow up again from hardy roots the next season.

Grapes deserve first mention in the class that does not die down in the fall. As we write we have in mind a poultry and fruit farm where well established grape vines of varieties ranging from the hardy and rapid growing native wild to the so-called "tame" or vineyard kinds in purple, red, green and white in assorted sizes arched the driveways, festooned the fences, and draped the buildings, and served the triple purpose of supplying shade for the flock, augmenting the appearance of the establishment, and turning otherwise waste space into welcome dollars.

Woodbine, also called Virginia creeper, is another of the dependable hardy vines that leaves nothing to be desired so far as quick, dense and profuse growth is concerned, but it lacks the commercial value of the fruit produced by grape vines. Growing in a light, sandy soil in a very dry summer it may occasionally lose some of its lower leaves, but usually it manages to make normal rainfall suffice for its needs. With this in mind, however, it is well to tide over dry spells by soaking down the ground at the roots in extremely dry weather.

Trumpet vine and Honeysuckle deserve more than passing mention, and though not generally used, there is no reason why they should be reserved mainly for shading and beautifying porches on residences. Both are quite hardy, give the amount of shade desired, and are additionally attractive on account of their fragrant and attractive blossoms.

It may be well to advise against using Boston Ivy (Ampelopsis) for covering trellises or fences even in regions where it grows well. This beautiful vine is really intended by Nature to grow against walls of stone or brick where it can grip the rough and creviced surface with its sucker feet. It is not a twiner; neither is it supplied with tendrils as are grapes and woodbine, and for these reasons it is not well adapted for use on trellises, arbors or fences.

The hardy vines that survive by means of roots from which a rapid growth springs up in early spring are highly desirable except for one objection, though not a serious one. The dead growth that remains each fall should be removed by rights, and anyone who has per-

A LOUSY HEN NEVER PAYS

"Don't expect a lousy hen to pay a profit," says Henry Trafford, poultry expert and breeder, for nearly eighteen years Editor of Poultry Success. Keep poultry houses, roosts and nests thoroughly sprayed but don't stop there. It's not enough. Give every bird in your flock individual insurance against chicken lice and watch your egg production double. One application of YURMO POULTRY OINTMENT takes less than a minute per bird and is usually enough to keep that bird absolutely free from lice for three to six months. YURMO is just the thing to prevent or end head lice on young chicks, and is really wonderful for treating Scaly Legs. Should be in every Poultryman's medicine chest. H. J. Baker, California Poultryman, writes: "I have never seen or heard of anything that does away with lice like YURMO. Is everything you claim." A big can containing enough to last average breeder six months sent postpaid for \$1.00, or, if more convenient, send no money, just your name and address, and postman will collect on arrival. Satisfaction guaranteed or money refunded. Circular sent free.

formed the tedious task of stripping dead vines from trellises or from fence wire will agree that it is not a job to be idly classed as a pleasant pastime. Really it is a "chore" that requires time, patience, and more or less acrobatic ability and agility. This objection aside, the following vines are admirably suited to serve as shade providers, and contain among their numbers the most remarkable growers known.

Japanese Kudzu vine must be awarded the first place as our most rapid growing hardy climber. It will grow 8 to 10 feet from seed the first year, but its really miraculous growth takes place after the roots have become fully established in later seasons. There seems to be no set limit to the growth of old plants, 50 feet or more in a single season being not unusual. Its dense and leafy foliage covers well to make fine shade, and its purplish-red, pea-shaped flowers give a very pretty effect in late August.

Cinnamon vine is a beautiful hardy climber for any location where the vines can twine, growing 30 feet or more in a season from established roots. The leaves are thick and glossy green, making dense foliage that is always clean, healthy and free from insects. The white flowers, though insignificant in size, emit a delightfully delicate cinnamon-like perfume over a long flowering season.

Large-Flowering Clematis, to our eye at any rate, is not equalled in attractiveness by any other climbing plant, but its special requirements are somewhat different from those of most other hardy vines. For this reason it is not well suited for use unless proper conditions such as rich deep soil, perfect drainage, and an abundance of water can be supplied. For farm purposes this is seldom practicable. Virgin's Bower (*Clematis paniculata*) falls far behind its queenly cousin in beauty of blossom coloring, but more than makes up for this defect in hardiness and general thrift. As an emergency shade producer it serves our purpose well, growing rapidly from roots that require neither attention nor the ideal soil conditions demanded by the large-flowering relative. Its small leaves mat closely together to form dense and cheerful green foliage against which the tiny fragrant white flowers appear in great profusion in August and September. It would be difficult to imagine conditions under which it would fail to thrive; for this reason, as well as for its other good qualities, we give it our unqualified indorsement as a climber that is fully able to "shift for itself."

Wisteria is one of the most beautiful of the hardy climbers, producing in May or June great clusters of pure white, violet-blue, or deep purple blossoms depending upon the variety. Seen in full bloom the massive trusses of flowers seem to occupy the vine to the entire exclusion of leaves, the loose panicles measuring as much as 3 feet in length. The foliage is delicate and lacy, however, producing less shade than several of the vines already mentioned. For this reason it would hardly serve our needs unless grown in combination with some other more leafy climber. Still, we cannot pass it by without at least giving it the mention it so justly deserves as a beautiful vine with which to bedeck porches, trellises and arbors.

In conclusion let us simply call attention to the necessity of placing orders for seed of any kind, or for cuttings of roots, as early as possible. Late ordering often results in serious delays that make for poor service and uncertain results. Also, take our advice and order only from reputable seedsmen; those advertising in this paper may be safely considered, and dealt with with full assurance of satisfaction, honest, and integrity. Avoid unknown dealers or obscure ones. Avoid likewise poor, antiquated stocks of seeds in local stores. These are often consignment stocks that have lost much of their vitality and germinating power through years of drying in show cases. Get the best. Get it fresh. Know what you are buying. It may cost a bit more, but it will be cheaper in the long run.

Chicks In May.

May is the best month of the year for hatching little chicks. Feed them well, provide shade and water this summer, let them roost in open-air houses, and if, in addition, you have a green patch of ground for them to run on, your May hatch will produce splendid chickens.

If you raise Chicks the above real photograph will convince you of the vital necessity of The Conkey-Norwich Chick Feeder

Feed outside—protect the feed in this wonderful device from Showers, Sun, Rain; from the older birds and from pollution—and watch your chicks develop. As one user expresses it: "The growth of my chicks this season, fed outside in your feeder with Conkey's Growing Feed, is astounding."

SURE QUICK DEATH FOR RATS AND MICE

**Remarkable Triple Strength
Virus Kills Every One
Not A Poison**

Marvelous French Discovery

Rats are your enemies. They destroy your building, eat your grain, kill your poultry, start fires and spread disease in every community. You need no longer suffer these losses—You can now, in a week's time, easily kill every rat, mouse or gopher with Rat Virus, the great French discovery. Our triple strength virus is the most powerful concentrated deadly virus known, the only sure, safe rodent destroyer.

Triple Strength Virus is absolutely safe to use anywhere—positively not a poison. No danger to chickens, horses, cattle, hogs or dogs. Harmless to children or grown persons. Affects only rodents.

Triple Strength Virus is prepared in a scientific laboratory and contains only Virus germs deadly to rodents. The bottle and corks are sterilized and sealed air-tight, so that all other germs are excluded. This is why Triple Strength is so deadly. It is tested on rats, mice and gophers before shipment—it cannot fail.

Rats Die Outside

Triple Strength Rat Virus is easy to use. Simple directions show how. A simple rat eating the virus gets sick with a contagious plague disease that affects and kills all rats and mice in the immediate vicinity. Rats flee because they become infected with a plague that affects the heart, blood vessels, and lungs, destroying the blood corpuscles and causing suffocation. The rats rush outside where they get fresh air and water. When the diseased rats get outside, they never get back for the disease is then so far gone it kills them. No odor, no dead rats to handle, no live rats to kill.

Special Introductory Offer

We want to prove to you our claim that Triple Strength Rat Virus is the most potent, most powerful—yet non-poisonous and absolutely safe—rat virus on the market. It is a TRIPLE STRENGTH Virus. Contains more living rat virus germs than any other rat killer made and will go one-third to one-half farther. To introduce this powerful Triple Strength Rat Virus, we will make every reader of this paper—for short time only—a special offer of a regular \$2.50 bottle for only \$1.00 postpaid. This \$2.50 bottle Triple Strength Rat Virus is enough to clear a poultry house, home or yard of rats and mice. Should you have several buildings infested with rats, it will pay you to send \$2.00 for our big \$5.00 Jumbo Size bottle. This Jumbo size bottle contains three times the quantity of Triple Strength Virus as our regular \$2.50 bottle sold for \$1.00. Send order today sure.

Money Back Guarantee

Your money back if it fails. Take no chances this year with traps or rat poisons. Triple Strength Rat Virus will positively kill rats, mice and gophers and be absolutely safe and sure. Give it according to directions—if after 30 days' trial you find any rats or mice—we will refund your money without question.

If not convenient to send money today—just send your name and address, a postal will do—pay postman on arrival. Remember it costs you nothing if it does not do all we claim.

The Best Growth is Made on Fresh Ground

(Continued from page 585)

at harvest time when they might cause considerable waste.

The problem of keeping the soil sweet in the brooding yard can be easily solved where colony brooders are used if the brooding houses are moved at frequent intervals. A satisfactory manner of handling the brooder is to bring them up close to the dwelling during the early spring season when the chicks are small and the fires require considerable attention. At this time a plot fall seeded to wheat or sown to early spring seeded oats makes an ideal pasture for the young stock, and the growing crop helps to keep the soil purified. Later on, after the chicks have passed the stage where they require heat, the brooder house can be moved out into the edge of the corn field or some other location where the growing stock will have free range and will not be molested by the mature birds.

For the poultry keepers who have stationary brooder houses the soil can be kept in fairly good condition for the growing stock by fencing off as much space as is available around the brooder house and by keeping this cultivated and planted in some quick growing crop while the chickens are using it. After the brooding season is past all poultry should be excluded from this lot and the land be seeded to wheat or rye to help dispose of the accumulated manure.

For the poultry keeper with very limited range the very least that can be safely done is to provide alternate pens and cultivate one and sow it to some quick growing crop while the birds have the range of the other lot. When plenty of land is available intelligent care is the only thing needed to prevent soil contamination, but where the area is limited hard work is the only means of salvation from the dangers of tainted soil.

Poultry Meat Production Should Be Developed.

(Continued from page 586)

Fourth, caponize early in the season. In many sections this operation is delayed until midsummer, when the weather is hot. The writer in several different tests has proven that caponizing done in June is preferable to later summer work. There are reasons why. The weather is more favorable, a great help in cutting down mortality, and preventing any setback. The capons have time to heal and get started again, for caponizing does retard for a few days at least, before the heat of summer really begins. And then the other important reasons lies in the fact that the youngsters are given that much better start toward development.

Fifth, range and field room over which capons and roasters can roam during the growing season is a great advantage and cuts down materially on cost of production. This is perhaps the best reason why poultry meat production is of greater interest to the farmer with many acres than it is to the intensive poultry producer with a very limited acreage to fall back upon.

Sixth, a well balanced growing ration fed rightly is essential. Capons and roasters do not make quick and rapid growth on nothing. They need feed and lots of it. A grain ration of cracked corn, two parts, and one part each of wheat and clipped oats makes a good growing scratch. Give them free access to green food, in pastures, preferably, and plenty of sour milk. These latter two foods contain vitamins that enhance and force growth.

Seventh, room is required. The young males, either caponized or not, should be summered separately from the pullets. It is also better to keep the capons separate from the uncaponized males.

Caponizing.

There is little doubt but that in most instances caponizing pays. It is not a difficult operation. It necessitates special instruments but these are not expensive, and soon pay for themselves many times over. It requires some practice to acquire skill or speed. In

LICE?

With their scissor-like jaws they bite constantly—thousands of them at one time—irritating the fowl almost beyond endurance, robbing it of blood and rest, cutting down its vitality and rendering it an easy prey to disease. No wonder lousy chickens never do well for themselves or their owner. When a fowl seems restless and picks at itself, look for lice.

Go After Lice Quickly with Conkey's Lice Powder. It comes in a handy package with a sifter top, making it easy to dust the powder thoroughly into the feathers. Body lice don't like it—help to keep your flock free by occasional dusting.

Conkey's Lice Liquid helps to rid your fowls and houses of mites. For painting roosts, fittings, nest boxes and wherever mites congregate. We guarantee it to satisfy you.

Conkey's Lice Fix is an ointment—a new and very effective way of fighting body lice.

Conkey's Head Lice Ointment helps to overcome the head lice that "eat up" baby chicks.

Insist on Conkey's. If your dealer cannot supply you, write us. Send 6c in stamps for Conkey's Big Poultry Book.

planning to caponize the surplus young males, bear the following points in mind:

First, operate when the youngsters are about one and one-half pounds in weight. Do not go by age, but by weight and development.

Second, starve, by withholding both food and water for forty hours previous to operating, in order to empty the intestines. This will make the operation much safer and faster and easier.

Third, a barrel with one solid end still remaining intact makes a good operating table. Stretch the birds over the table, and fasten down. The area between the first and second ribs from the rear should be in full view.

Fourth, in making the incision make one clean, quick cut rather than clip a little at a time, cutting through both skin, muscle, and clip the membrane, exposing the intestines and organs to be removed.

Fifth, learn to remove both organs from one side, thus doing away with the necessity of making two incisions, one on either side.

Sixth, operate quickly and smoothly, being sure to remove both organs and all of each.

Seventh, mark the capons after operating.

Eighth, give soft food and water upon completion of operation. Keep cool.

Ninth, watch out for wind puffs on the sides, piercing same.

Make the surplus of the heavier breeds transform feed into flesh at a profit for you.

Barred Rock Hen Lays 324 Eggs

(Continued from page 587)

to select the best individuals each year, for even in a well bred flock having a high average production, the variation in individual hens is great.

The value of all poultry products in the United States is more than a billion dollars a year, yet the average production of each hen is about 70 eggs a year according to the latest federal census. Oregon's 324 egger produced four and one-half times that number and she comes from a family that by scientific breeding has been made to lay more than three times the average number of eggs.

If the simple plan of always breeding from the best could be universally followed it would add one third to the value of this country's poultry products. This might mean cheaper eggs but it would increase consumption, give the producer a larger return from his feed, and would reduce the cost of renewing his flocks.

[Note: There is evidence to show that egg production is higher on the Pacific coast than in the eastern and central states. When Pacific coast birds are shipped to eastern egg competitions, they fall about 40 eggs below the coast records. If climate did not play a beneficent part, Pacific coast poultrymen would be badly handicapped in being far removed from eastern markets; and for business reasons poultry plants would all be established near the grain supplies and markets. As a result of their extra 40 eggs a year, the situation is somewhat equalized for them. F. L. P.]

Insurance for Poultry.

One of the advantages of belonging to the Poultry Club, England, is the privilege of insuring your fowls with Lloyd's. The manager of the Western department of Lloyd's Underwriters, Springfield, Ill., advises us that he has set aside a special deposit of \$25,000, with a surplus of \$100,000, and will write insurance on purebred poultry. Fire will be covered by one to three year policies, and death from shipment to show by one, three or twelve month policies.

KILL THEM ALL

Every Rat and Mouse easily destroyed by New Discovery Not a Poison

Absolute freedom from rats and mice is now assured everyone. No more trapping and poisoning just a few. Clean out the whole bunch, old, young, big and little.

Hick's Rat Killer kills every rat or mouse on your place. Most wonderful of all it does not harm anything but rats, mice, gophers, and other rodents. It is harmless to children, pets, poultry and all kinds of stock. It can be spread anywhere and will kill only rats and mice. This death bringing disease rapidly spreads and quickly destroys all the rats and mice. There is no smell or odor for they run outside for water and die away from the building.

A Trial Costs You Nothing

Mr. Hick is offering everyone troubled with these pests the chance to get rid of them at no cost to themselves. He will send three large double strength, one dollar bottles for the price of one. You keep one for yourself; the other two you sell to your neighbors at one dollar each, thus getting your own free and in addition making a dollar profit. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 884, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after two weeks trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

Have established their undisputed supremacy by winning 76 out of a possible 83 ribbons at Washington, Philadelphia, Trenton State Show and Trenton Inter-State Fair. My free illustrated circular describes these conclusive victories in detail. Send for your copy today.

I am offering choice hatching eggs from 20 wonderful matings at \$15 per 15; \$28 per 30; \$40 per 50; and \$80 per 100. Above prices reduced to one half after May 15th. Also great reductions on my choicest breeding birds at same time.

Beginners Luck Not Equal to Perseverance.

(Continued from page 588)

hens boost the egg record.

The chemists tell us that both hen and egg are more than half water; it is rather clear

then that the water supply should be never failing. Where water is available only at intervals as is the case in winter when provision is not made to keep the water unfrozen, the egg factory suffers a partial shut down, and when the water supply is still more irregular there is a complete shut down.

What has been said of mash hoppers is equally true of water fountains or pans. They should provide drinking space for a number of fowls. When the winter non-freeze fountains are put in use two or three one-gallon cans rather than one large can.

Set the watering device up off the floor or ground so the fowls can not track in and out, and make the water unfit to drink.

When the fowls are watered out doors the fountain should be placed in the shade and the ground around should be kept in a sanitary condition by frequently cleaning and disinfecting the soil.

Clear, fresh water at all times in fountains that will serve a number of thirsty fowls without waits will help to keep the egg record from slipping.

Don't compel the fowls to form a water line as shown below.

Last but not least on our feeding schedule is the grain fed in the litter.

Those who keep chickens confined depend very largely upon litter feeding for properly exercising the fowls. They must be induced to exercise if they are to be healthy, active and profitable.

Corn should always be cracked to the size of the wheat and oats. A crop full of shelled corn is too quickly picked up and with too little effort.

Litter soon becomes packed, but it should never be discarded until dirty, as the fowls get their best and hardest work out in packed litter. Fresh litter is easily kicked aside and the grain eaten off the bare floor.

SAVE THE LIVES OF BABY CHICKS

50 Cent Package FREE

Just because a lot of the baby chicks you have hatched or bought each year die the first month or so, don't think such condition unavoidable or that you cannot raise at least 90 per cent of your chicks to market and laying age.

Have your chicks this year strong, healthy, active, vigorous, with no white diarrhea or other bowel trouble, colds, leg weakness, droopiness, etc.—the kind that develop into early layers and big, husky broilers. Try feeding

Chicklivia

the safe and harmless but active toning and energizing agent for young chicks up to three months of age, and watch them live and grow like weeds. W. H. Hall, Washington poultryman, writes: "Last spring I brooded 1,000 chicks with CHICKLIVIA and lost only 67, so think it O. K." For assisting chicks over "the danger period," giving them strength and vigor and aiding the building of flesh, feather and bone and tissue, its action is really wonderful.

To prove that CHICKLIVIA does save the lives of baby chicks and keeps them strong and healthy, we will send to any poultryman who has never used it one 50 cent package free if you will cut out this notice and mail it with 10 cents to help pay distribution expenses to The Standard Poultry Service Co., 860-K, Herald Bldg., Binghamton, N. Y. Send at once and you will receive a regular 50 cent package without charge or obligation to buy more. Only one package to an address.—Advertisement.

Palmer's Barred Rock Bargain Sale

Hatching eggs and breeding stock, priced at an approximately 50 per cent reduction in price. This is your opportunity to hatch winners from some of America's finest Barred Rocks. Our present and past winnings prove that statement too. Write for illustrated printing matter and special bargain sale prices. D. F. Palmer & Son, Box 36, Yorkville, Ill.

\$4 Sparrow Trap

Postage Extra

Extra cage for emptying sparrows, no charge. Fifty sparrows eat 1 bushel of grain a month. Ever-Set Trap stops grain losses, saves money. One man caught 65 one day; another 1,005 in two months. Galvanized wire mesh; lasts indefinitely. Guaranteed satisfactory or money back. Free instructions for setting, baiting. Order direct today. Ever-Set Trap Co., 1002 W. 15th St., Davenport, Ia.

KILL LICE ON POULTRY

with PINCH-DIP

Can be used in dry form as powder or mixed with water for dipping. Pure chemical. No adulteration. Every bit of it kills lice. 75 cents pound by mail postpaid. Agents wanted. Home Products, Inc., Rahway, N. J.

Unless there is a window beneath the dropping board the litter will pile up back there as the fowls work with heads to the lighted front and kick the litter to the rear. If it is necessary to rake the litter forward before scattering the grain, rake it up roughly in little hills.

But the hen should be deprived as little as possible of this form of exercise. Let her shake up the litter whenever possible.

Now if the grain is all scattered at once most of it will be on top of the litter and the fowls will need to work only for the last few

"Let her shake up the litter"

grains. We throw out a little grain, then wait a moment or two for the flock to start digging. When the litter is well loosened and a-flying the rest of the grain is thrown in and will now work well into the litter where every grain has to be dug out.

Sprouted oats are litter fed to some extent, for our oats are fed when sprouted about one-half inch.

The Runt.

A target for cullers, condemned, hustled to catching coop and market, the much maligned runt hen in spite of her bad reputation is often neck and neck with the best layers in the flock.

Such is the writer's opinion of and experience with hens that fail to weigh up to standard.

The cull may be a runt, but lack of standard weight is not necessarily indicative of constitutional weakness so the runt may or may not be a cull.

The human runt when called upon to defend himself draws upon history to prove that some of its most exciting chapters were put there by those of Tom Thumb-like stature from before Napoleon down to "Bud" Fisher's famous little Jeff. Those who are familiar with "Bud's" team know that it is not the abbreviated Jeff but his big partner who is A. Mutt.

While there is no "Biography of Famous Fowls" there is ample record of runt hen performance and it should earn for her a complete apology from poultrydom.

Such a record is to be found wherever egg-laying contests are held. Among the winners will be found hens that fail to attain standard weight by ounces, numerous enough to classify them as plain runts.

It is said that the runt falls an easy prey to disease, that she lacks vigor and breaks down.

That has not been the writer's experience. Invariably from two to five per cent of the flock will be undersized birds, which, if

Nobody loves a runt.

they have "pep," are put in the laying house, work through the winter under lights, lay and hold up as well as their heavier sisters.

For obvious reasons where selective breeding is followed only birds of proper weight qualify for the breeding pens.

One reason is that from a breeding standpoint, unless size is maintained by selection, the size of your birds will diminish, and with

First
Oil-
Burning
Brooder

Who Originated the First Oil Burning Canopy Brooder?

There has been some confusing statements made with regard to who originated the oil burning canopy brooder. In order that the poultry raising public may know the FACTS we show here the FIRST one ever made. It was made by H. M. Sheer years ago, and tested for several years before being offered to the public.

From this first and original brooder the now famous Sol-Hot Brooder was perfected—all of the improvements are covered by patents issued to H. M. Sheer.

The Only Heater With Positive Oil Control

The Super Sol-Hot is the only heater on the market with a positive oil control—it is accomplished with a patent thermostat and float (like on a carburetor) which maintains a constant oil level that insures an even burning flame all the time. Sol-Hot requires no regulating—it has no valves or springs to adjust—it is automatic. It is equipped with patent non-carbonizing Metal Vaporizer which does away with the old-fashioned troublesome wicks and asbestos ring vaporizers.

Super Sol-Hot Heater for Canopy Brooders and Incubators

Equipped with Patent Metal Vaporizer

Why Buy Imitations — Get the Best

32 in., 42 in., and 52 in. Canopy

When you are in the market for an Oil Burning Canopy Brooder, come to the originators for it, be on the safe side and get the best. Send us your name and address and get our free descriptive folder telling all about this better heater and canopy brooder. Get the facts and you'll never buy anything but Sol-Hot.

H. M. SHEER COMPANY
Dept. 26, Quincy, Illinois (25)

this decrease will go flesh value. The small, precocious bird is the first to lay, and rarely attains the full size that is characteristic of her breed. She commonly lays a small egg. It such females are used for breeding, it is likely that not only the size but the strength of your strain will diminish. While bantams are strong, they are strong because they are true to their natural size. There is a size or weight that is characteristic of every pure breed. Great variations from that standard size are not desirable in breeding birds.

Don't judge a hen by her inches.

But, from the standpoint of what the little bird will do, from the mere standpoint of how well she will lay, irrespective of her breeding power or her influence on the variety, it will be found that a small size does not make her less productive. In point of fact, she is often an especially active, good laying bird. Therefore, in culling a runt for egg production, pass up the foot rule and judge by performance.

Light and Dark Barred Rocks

Let me add my humble mite in protest of the proposition to divide the Barred Plymouth Rock into two distinct kinds, the light and the dark. Being a young breeder and immediately concerned with whatever action is taken in this respect I feel I am entitled to express my view on such an important subject.

To begin with, were I absolutely ignorant of the subject I would, as a matter of decency, take heed of the sound and practical viewpoint of such Barred Rock breeders as E. B. Thompson and Judge Newton Cosh, who are recognized authorities on the subject of Barred Plymouth Rocks and are most emphatic in their disapproval of such division.

Everyone knows that the breeding of the Barred Plymouth Rock is one of the most specialized sort of businesses. Anyone telling you different is ignorant of how to breed the breed. Practical experience has proven that in order to obtain the best results the double mating is the proper channel. Now, I would like the effort of the breeders to be directed more and more, instead of less and less, toward standard or single mating, because, the breed should be made ever easier to breed. There are a million poultry keepers, but comparatively few breeders, and in the case of the farm flocks, the number of farmers keeping poultry as a side line is considerable, yet they do not know a single thing as to how to mate the birds. They take the most promising cockerels and head their flocks with them and let God and Nature do the rest. Of late years the right kind of education has been broadcasted and the beneficent results are apparent on every side, but even with this education there are legions who know absolutely nothing about mating chickens.

Therefore in the case of unicolored birds the results are not so apparent, but when it comes to particularized or varicolored birds in some instances, the degeneration both in color and general appearance is tremendous when the varieties are left to amateurs.

I stop now to laugh at the mediocre specimens which won when I was a boy; birds that I exhibited. They were good, as good perhaps as were commonly produced 13 years ago, but far from the present day Standard; and the improvement that has taken place has certainly not been due to the efforts of the gentry presently crazed over this idea of division of the breed into light and dark classes, but only and only due to the consecutive work of such masters as Thompson and Cosh.

It is a Godsend, this delay of a year in considering the question. Let us hope that the younger element who voted lightly and in most cases unknowingly, on the question as presented by the club will reconsider their mind and reverse their former vote.

To recognize two varieties would be a case of the young, the amateur, the inexperienced, dictating to the matured, the past masters, and at the expense of the most wonderful breed of poultry ever developed.

Still Hatching Eggs Time!

VERY FORTUNATE is the Poultry Industry and all persons who are engaged in it, because of the fact that the most valuable breeding results in this business can be safely transported almost anywhere in the form of EGGS FOR HATCHING. By reason of the great VITALITY of Hollywood Farm Stock and our method of packing their eggs for shipment, the GUARANTEE 90% fertility, covering all shipments made by us.

IT IS A FACT, Reader, that the World's-record highest individual Leghorn layer—336 eggs—not only was hatched from Hollywood pen-sisters with trapnest records of only 250-259 eggs, but it also is TRUE, absolutely, that ANY CUSTOMER of our Farms that season for Hatching Eggs might have received that identical egg in a low-cost setting! Such chances occur frequently in cases where there are years of rigid, selective breeding immediately back of these moderate-yield but highly vigorous specimens.

ALSO IT IS A FACT that from our record-breaking Hollywood Pen No. 5 that produced TWELVE 300-eggers and better in ONE SEASON and the ENTIRE number of pullets from which that were trapped AVERAGED TO LAY 255 47/74 eggs in 365 days—that FROM THIS unequalled mating of high-producers we sold fully one-half the eggs FOR HATCHING, doing this throughout the breeding season and sold them at live-and-let-live prices. Following have been our 1922 prices for hatching eggs, with the records of the birds that are producing them:

Price of Hollywood S. C. White Leghorn Eggs

200 to 229 Eggs by Males from 250/259 Egg Dam.....	\$ 5.00 per 15, \$25.00 per 100
230 to 239 Eggs by Males from 260/269 Egg Dam.....	7.50 per 15, 35.00 per 100
240 to 249 Eggs by Males from 260/269 Egg Dam.....	10.00 per 15, 50.00 per 100
250 to 259 Eggs by Males from 275/279 Egg Dam.....	12.50 per 15, 70.00 per 100
260 to 269 Eggs by Males from 283/290 Egg Dam.....	15.00 per 15,
270 to 279 Eggs by Males from 283/290 Egg Dam.....	20.00 per 15,
280 to 289 Eggs by Males from 298/304 Egg Dam.....	25.00 per 15,

Half Price Egg Sale Now On

Starting May 6th and lasting throughout the rest of this season, you can cut the foregoing prices SQUARELY IN HALF, or for each sum of money listed we ship you TWICE the number of eggs—your choice. Ninety per cent fertility guaranteed. You can order with perfect safety directly from this advertisement, provided you do not delay. All orders filled within 24 to 48 hours after receipt. Telegraphic orders accompanied by payment given prompt attention.

Eggs Shipped One Thousand to Three Thousand Miles

Lakewood, Fla., April 4, 1922.
Hollywood Poultry Farm

I thought you would like to know what kind of a hatch we had from the three sittings of eggs we bought from you. We got twenty-nine chicks, one was a cripple which we killed, and one died on the second day, leaving twenty-seven. They are sturdy little fellows and growing fast. We think we have had very good results considering the long distance these eggs traveled. Very truly,
E. Hawkins, R. A, Box 163.

Hollywood Poultry Farm: Berlin, N. Y., April 10, 1922

Received 105 eggs on March 16th, not a cracked egg in the lot. Put them in the incubator the same day and I tested out eight on the seventh day and four on the fifteenth day. On twenty-second day took out 80 chicks, 79 of which are hale and hearty. I think this is a remarkable hatch for the distance they came. My own eggs which I put in at the same time hatched 62 per cent, so you see you can ship them three thousand miles and then beat me. You will hear from me later after I have trapnested these pullets. Respectfully,
William Bell.

Boerne, Tex., April 2, 1922.

Hollywood Poultry Farm:
Let me tell you how I came out with the sitting of eggs we got from you lately. The hens broke the two extra eggs you sent me, so I put the remaining fifteen under one hen and after testing them I found one infertile egg and therefore hatched fourteen strong chicks and am very much pleased. I am strong for the Hollywood strain and shall not be satisfied until my entire flock is pure Hollywood. Very truly yours,
E. G. Fortune.

DAY-OLD Chix-Dux

1887-1922

Our **EARLY MATURING NIAGARA STRAINS** reach full development from three to five weeks sooner than the average strain, having been mated by the Hogan test along these lines for over sixteen generations. They are of special value to the poultryman or woman who purchase their chix at a time when weather conditions are most favorable for the successful rearing of chix with the least possible time and labor.

Burt, N. Y., Mar. 8, 1922

Gentlemen: I have 34 pullets raised from chix purchased of you last season. They commenced to lay in November and have averaged 21 eggs per day all winter. They have done the best of any chix I ever had. **THEY WERE JUNE HATCHED CHIX.** Yours, Mrs. G. C. McCarthy.

Buffalo, N. Y., Aug. 17, 1921

Gentlemen: On the fifth day of August one of my pullets raised from chix purchased of you this season, laid her first egg. She was just **THREE MONTHS AND TWENTY-FIVE DAYS OLD** and I consider this a world's record for White Rox. Very truly yours, J. E. Donovan.

White, Buff and Brown Leghorns, White and Barred Rocks, White Wyandottes, R. I. Reds, Anconas, Black Minorcas; Pekins and Indian Runner Dux all bred with painstaking care along the lines above mentioned.

Worth Millions to POULTRY

Thirteen years ago, I lost 3,800 fowls in three weeks from Roup, Cholera and White Diarrhea, when a Scientist in a few days—by a newly discovered formula turned my PEST RIDDEN fowls into the prettiest flock I ever saw. I bought his formula and named it "OCULUM." Now, Disease has no horrors for me, I have cured fowls by the thousands.

As a test, I put sick fowls with a well flock and "OCULUM" healed the sick and kept the well ones well.

"OCULUM" makes hens lay and retards setting. I do not have 2 setting hens in 5 all summer. My fowls molt quickly and often lay during molt. Some hens lay while raising their brood—Roosters keep PRIME and broilers grow big and fat.

My "OCULUM" takes the place of ALL TONICS AND REMEDIES, and has spread to 5 continents. Journals, Experiment Stations and Fanciers praise it. This Journal O. K.'s it.

Bradley Bros., Lee, Mass., of world wide fame, say, "OCULUM" has NO EQUAL." They have used it for 10 years.

The Baltimore Sun says, "OCULUM" is a wonderful remedy and highly recommended." H. C. Miller, Judge A. P. Assn., Akron, O., says, "OCULUM" made 48 hens jump from 8 to 42 eggs a day."

It is cheap and harmless. Feed only one drop a day per hen in the feed. When fowl is sick you inject it.

Sample 10c, Bottle 50c and \$1 postpaid. Booklet free. The "Oculum" Co., Salem, Va., Box B. Dealers handle. Guaranteed. Agents wanted.—Advertisement.

Start Early on Red Mites.

One of the simplest, easiest and most valuable things I have found in the last twenty years relates to how to get rid of the common red mite for all time. Just take common, cheap, even rancid lard and melt it and while hot add same amount of common coal oil and apply while hot to the roosts, perch supports, and all cracks around the roosts, nests, corners of the brooders, brood coops, and colony houses. One good application early in the season with a flat paint brush will last the whole season, and I have known one application to last two seasons. Not a sight of a mite in that time.

The only precaution that is necessary is when using around the nests of breeding pens, remove all nest material and replace with fresh straw after the application. It would be bad for hatching eggs should any of the grease touch them, but that is easily avoided.

The explanation is simple. Any kind of grease is fatal to a mite and should any mite eggs be left, as soon as they hatch, and the small mites crawl out and touch the grease it is "good bye" mite, and none is left to tell the tale. Be careful to use the emulsion freely on the underside of the perches and the supports.

Wisc.

W. A. Hoyt.

Feeding Little Chicks

Excellent results can be obtained by keeping buttermilk or clabbered skim-milk before the little chicks from the time they are first placed around the brooder until they are at least four weeks old—and longer if you can obtain the milk. During this period, the chicks will thrive better without any water to drink.

After the chicks are forty-eight to sixty hours old, fine scratch feed can be fed. This can be either a good grade of commercial chick feed or a home-made mixture of equal parts by weight of rolled oats, corn cracked fine, and cracked wheat. This scratch feed can be fed five times a day for the first day or two—giving the chicks all they will eat up readily each time.

Then a dry mash can be placed before the chicks, made up in these proportions: 3 lbs. wheat bran; 2 lbs. corn meal; 1 lb. dried buttermilk; ½ lb. bone meal; ¼ lb. charcoal.

The charcoal may be omitted after the chicks are two weeks old. If the chicks do not eat the mash readily, it can be fed once or twice a day moistened with buttermilk.

One or two light feedings each day of hard boiled eggs, ground up, shell included, can also be fed. Eggs tested out of the incubators as infertile and even those containing dead germs, if the latter are not too far advanced, can be used for this purpose.

Do not be alarmed if the odor of these eggs is offensive. If they are thoroughly cooked, all harmful bacteria will be destroyed. The chicks like these ground eggs and will thrive on them. Quite frequently the number of eggs tested out of the incubator is limited. Where this is the case, market eggs can usually be fed to the little chicks economically for the first two weeks.

If their scratch feed is fed in short

MORE EGGS—MORE MONEY
Feed **CRY-CO.**
A purified shell grit (cubical) guaranteed 99% Pure Carbonate of Lime.
Need no oyster shells or other grit, better results, less cost. Fine for little chicks. Highest endorsements. Write for booklet.
W. A. RUSSELL & CO., St. Louis, Mo.

clean litter, the little chicks will get plenty of exercise. Be sure there is plenty of sunlight and fresh air in the brooder house. A little runway or yard in front will encourage the chicks to take further exercise in the open.

A little clean, sharp sand spread on the floor will furnish the chicks the necessary grit. Sand which contains clay or other foreign materials may become hard and packed.

It is a good plan to thoroughly sterilize all chick fountains and feed pans daily.

Chicks do best if given green food. However, if none is available, satisfactory results can be obtained if alfalfa or clover, chopped fine, is used as litter.

Good results will be obtained if the temperature is 100 degrees F., when the chicks are first placed around the brooder. The heat can be reduced one degree each day until the temperature has been dropped to about 80 degrees F. The thermometer will give the correct readings if hung about six or eight inches in from the edge of the hover and two and a half inches above the floor.

This is the method used by the Iowa State College Poultry Plant, and is based on experiments carried on last year by the Poultry Section of the Iowa Agricultural Experiment Station.

189 chicks, under this system of feeding, weighed 90.5 pounds at four weeks of age.

Skimmilk or buttermilk can be figured at 25 cents per 100 pounds. Where this milk is selling at more than this price it will be necessary of course to charge the price in your community.

Stock beets, mangels, sugar beets, or garden beets when fed to the poultry as green food may be charged up at 75 cents per 100 pounds. J. J. Warren.

Prices for Exported Fowls.

Just noticed in April A. P. J. "A Mexican Breeder's Complaint." May I contribute just a brief word on this subject for the benefit of your readers? Away back in the 80's we sent to a well known firm in England for 3 White Minorca pullets. The Minorca craze was raging greatly in America at the time. But we were young and inexperienced in the chicken business and considered \$3 each a good price to pay for ideal specimens of any variety.

We ordered the 3 pullets at a cost in England of about \$10. In the meantime our expectations ran high, as we thought of the arrival of the 3 English beauties. But, lo, and behold, when the consignment arrived from across the sea, and we were privileged to look into the hamper, we were crushed with disappointment and disgust. Three miserable, delicate, undeveloped white birds, called White Minorca females. Total charges, including purchase price, \$31.50. We were in our boyhood days, and had accumulated that \$31.50 from the credit side of our poultry account the year before, as the result of raising a bunch of Silver Wyandotte youngsters and advertising them in a farm paper. We had simply met our "Waterloo." But we had some important things to learn. We are older now, and realize that at that particular time, good specimens of the White Minorca variety could not be bought under \$10 to \$25 a bird.

Now the writer has observed in his experience of later years, that prospective buyers in foreign countries, particularly in the southern Lands, do not fully appreciate the fact that a \$10 bird cannot be bought for \$2 and \$3 each. Excessive transportation charges doubtless constrain them to make the first or initial cost as little as possible, but in this they are not wise. Not only in the foreign countries, but also in our own land, people need to be instructed in the knowledge of relative values that obtain in thoroughbred poultry. We all sympathize with Francisco Beltran, Jr., and by no means commend the breeder who sent the culls to him, but may we all become wiser from Mr. Beltran's experience.

Dr. Geo. B. Edwards.

From All Over the Country come orders for thousands of KNAPP'S "HI-GRADE" CHICKS

Never have we hatched such quality. More vigorous chicks never came from any incubator. Customers marvel at the size and constitutional vigor of "HI-GRADE" chicks.

Hundreds of last year's customers are ordering again. They tell us of early maturity and wonderful laying records. They praise the beautiful plumage and color markings of "HI-GRADE" chicks. What more could one want. You can't get these qualities in poorly bred and poorly hatched chicks.

Raise Big, Husky Chicks

How to Keep Chicks Growing—Save Feed—Prevent Lice and Mites

Free 96-Page Book Shows You How!

Written by Prof. T. E. Quisenberry

HIS remarkable success in raising big chicks has made him famous the world over. This Free Book tells you the secrets of raising every single chick and how to develop them quickly for early marketing.

It's brimful with simple, easy-to-follow instructions that years of practical experience have proved most successful, and which have enabled thousands and thousands to turn failure into splendid profits. Beginners as well as experienced chick raisers should get this Free Book, "Dollars and Sense in the Poultry Business."

All the time and labor you devote to hatching is lost if you don't know how to successfully and quickly raise chicks for market and early laying.

This Free Book tells you:

How to Brood Chicks Correctly.
How, When and What to Feed.
How to Grow Chicks for Market.
How to Develop Chicks to Early Layers.

How to Prevent Bowel Trouble and White Diarrhea.

How to Grow Chicks and Save Feed.

How to Prevent Chick Lice and Mites.

How to Prevent Cholera and Summer Complaint.

Write at once! Don't wait! Get this Free Book now! It opens the door to quick raising methods that assure quick, sure profits. Mr. Quisenberry tells you things in this Free Book about feeding and raising poultry that will be worth many dollars to you. Just send your name and address—a post card will do—to the American Poultry School, Dept. 2066, Kansas City, Mo.—Advertisement.

Fitting Utility Birds for Shows

By ARTHUR F. ROLF

Secretary National Single Comb White Leghorn Club.

Some astounding methods employed—"Production Classes" would encourage the practices—Egg production should be tested in egg competitions.

THERE certainly is a great deal of truth in the old saying: "We live to learn."

One beautiful day, perhaps a year and a half ago, the writer "learned" something which was a great surprise, almost a shock, in fact. Having a little time to spare in a certain town, visited on a business trip, I took the opportunity of visiting the poultry farm of an old friend. This farm carries a good flock of White Leghorns and has been successful in a financial way, both through the sale of market eggs and some hatching eggs and stock. Although this breeder has never, so far as I know, exhibited in the Standard Exhibition classes of any show, he has "pulled down" a good many ribbons in the "Utility Classes" at some good shows.

Stopping at the house, the good wife told me that her husband was "out back" somewhere. Instead of her calling him, I told her I would go on back and find him. I went first to a large stable where she thought I would find him, and in looking around for him I went into a room where I heard the noise of some chickens. And, right here was where I started to "learn."

I saw, confined to a string of exhibition coops, a number of hens which had some sort of a metal contrivance attached to the rear portion of their body. I couldn't make it out, so you can well imagine that this was one of the first things I asked about when I located the owner. You should have seen the look of consternation which came over his face (as he mumbled, "Who in H— left that door unlocked?")

But, having known each other for years, he finally agreed to tell me something about the situation after I had promised never to divulge his name, or to give away the "secrets" until such time as I found them being practiced on other plants. I shall fulfill my promise not to divulge his name, but as I have since found his "secrets" being practiced elsewhere he has agreed that I am not under any obligation to continue to hold back about the methods.

Without, at this time at least, specifying which of the practices mentioned hereafter were being practiced by this particular man, and which of them were discovered on other farms at a later time, I have finally agreed to set forth some of the practices which are enabling certain exhibitors to win ribbons in the Utility Classes of our present shows. I have hesitated about doing this, for many months, for two reasons: First, I do not know what percentage of our Utility Exhibitors are following these, or other, methods with similar objects; second, I doubt the advisability of disseminating information which might lead still others into undesirable, unethical practices. Until the time of the recent meeting of the Standard Revision Committee at

Chicago, I kept my knowledge to myself, but, certain things which were said at that time caused me to "open up," and I finally gave in to the requests of Frank Platt, and several leading breeders,

and agreed to prepare this statement for publication. I shall endeavor to state the case briefly; to avoid the use of names or such specific references as would identify the parties under discussion; and to call a spade a spade without any glossing over.

Utility Class and Fakirs

During the time elapsing between the day first referred to, and the present, I have found five exhibitors using part, or all, of the practices mentioned, and they have told me that they knew of other Utility Class winners using the same methods. From these observations, I honestly believe that there is more faking being done in the Utility Classes today, than there ever was in the exhibition classes.

I know that metal spreaders have been devised, and used, to stretch the skin of the vent, to produce a fowl which will show the large, loose-skinned vent desired in the Utility Classes. I know that metal spreaders have been devised, and used, to increase the width of the pelvic arch, adding one, or more "finger" width to this "production measurement."

I know that hens have been successfully fattened to an extreme point, and then by frequent massage of the abdomen, while on a ration which would cause them to lose this excess fat and flesh, the large, flexible, abdomen has been retained for the Utility Show. I am told that this same practice enables one to increase the "finger" capacity between the breast bone and the pelvic arch.

I know that shanks, beaks, and more or less exposed portions of skin have been, and still are being chemically bleached to produce the "lack of color" which shows "heavy production" in the Utility Class.

I know that at least one Northern exhibitor has been shipping hens to one of these Southern "conditioners," in order to get the enlargement of comb and wattle which results from the Southern climate, together with the abundance of animal life available here.

I know that certain of these "conditioners," both in the North and the South, have adopted the practice of "conditioning" their hens in rooms which are heated artificially, supplemented by the liberal use of raw meat, to obtain that enlargement of head points which is such an important factor in the Utility Class.

I know that growing youngsters are being purposely over-fed with animal proteins to force growth of these same head points to an excessive stage, in order to make a sales "appeal" to a certain class of buyers who think they know what "big combs" mean in the Utility Class.

Feed *Vitality* and watch it grow!

Do you want to grow your chicks into big, healthy fowls of large egg capacity? Of course you do. The only question is, HOW. You want a method that is *simple, accurate and sure.*

The Vitality System

Fulfills every requirement in the successful raising of hens. It is based on plain facts which everyone can understand and practice. Thousands of poultry raisers are proving its worth every day. Its housing and feeding instructions include all the modern improvements that twentieth century science has been able to develop.

Vitality Chick Mash With Dried Buttermilk

is easily digested and will give them a wonderful start. Its buttermilk content serves as the greatest bowel regulator known to modern science. It is fed for the first eight weeks of the chick's life and then a gradual change is made to

Vitality Growing Mash With Dried Buttermilk

A food that makes bone and muscle, large frames, and at the same time develops the egg capacity of the fowl. Many thousands of poultry raisers are getting bigger profits from their hens, simply by giving them Vitality Feeds. Read the experience of one poultry grower:

Write Mr. Whitney

the Vitality Poultry Expert, and he will help you solve your poultry problems. In addition to being a practical poultryman, Mr. Whitney is a former Editor of Poultry Departments in a number of the leading metropolitan newspapers. During that time he visited hundreds of big poultry farms throughout the country. Few poultrymen have had the opportunity to observe the methods and practices of the successful as has Mr. Whitney. His advice is free.

"I was not properly posted on what kind of feed was the best for chicks, so the results were failure after failure. I even put up my own feed. Yet I had poor results—weak, sickly chicks. Then I gave Vitality Chick Mash a chance with some more Brown Leghorns I bought. *In one month they outgrew the others.* It also stopped the white diarrhea and roup for my older hens by growing them more rapidly for early laying maturity. I find that by using Vitality Chick Mash I can buy chicks late in the spring and yet have early laying hens. In the fall I feed Vitality Egg Mash and get eggs throughout the winter."

Money Back Guarantee

The VITALITY SYSTEM will produce results. So sure of this are we that we *guarantee satisfaction* or your money back. Give it a trial; if it fails, we cheerfully refund your money.

Easy to Kill Rats and Mice

Amazing Discovery Wipes Out Every One—Not a Poison.

Don't be satisfied with trapping or poisoning just a few. Exterminate the whole bunch—old, young, big and little. Rats do millions of dollars' damage each year. They kill chickens, destroy grain, damage buildings, merchandise, and are filthy disease carriers.

A wonderful new scientific discovery called Imperial Virus now enables you to clear your place of every rat on it. The amazing feature of it is that it is not a poison and affects rodents such as Rats, Mice, Gophers, etc., only. It is perfectly harmless to humans, stock, poultry, pets. It can, therefore, be spread anywhere knowing it will kill only the pests you want to get. One rat affects the others and in a short time the whole colony is exterminated, root and branch. They die outside, too, hunting air and water.

YOU CAN GET YOURS FREE

The manufacturers of this amazing Virus, to get it quickly established and widely used, are making a Special Guaranteed Introductory Offer of two regular, big, full sized (double strength) \$1.00 bottles, for the price of one. Use one yourself and sell the other to a neighbor, thus getting yours free. They will also tell you how you can make money telling your friends about it. As this offer may not appear again, you should act at once or clip for future reference.

You need send no money; just your name and address to the Imperial Laboratories, Room 256, 2110 Grand Avenue, Kansas City, Mo., and pay the postman \$1.00 and a few cents postage, when the two bottles arrive. It costs you nothing if it does not do the work, as they positively guarantee to refund your \$1.00 any time after 30 days if you are not satisfied.—Advertisement.

POTTER & CO., 10 Forest Ave., Downers Grove, Ill.

I know that birds are being plucked, periodically, in order to obtain birds to show in the Utility Classes, apparently in the peak of egg production and "in the midst of a gradual, late molt," the replacement feathers being in different stages of growth according to the time they were plucked.

I know that feathers have been unnaturally soiled, roughened, and broken, just prior to showing them in the Utility Classes, in order to cater to the idea that the heavy layer "must" be in rough plumage.

I know that at least one of these exhibitors has discovered a chemical solution which will both bleach the skin, and given this same desired result in the plumage, except that it makes the plumage "too white," but he easily overcomes that by soiling it before it is fully dry.

These things I know—have positive, personal knowledge of them. Other things I have been told, by these same "exhibitors" in trying to prove that they were no more guilty than others.

One breeder, in whom I have much confidence, assured me that he successfully performs an operation on the pelvic bones, decreasing their thickness and increasing their flexibility. This, I do not know from positive, personal knowledge, but mention it as one of the factors these men have in mind, whether they have actually accomplished it yet, or not.

Another, boasting of his ability to "put it over" the Utility Judges, stated that the hen with which he had won first, as well as two specials, the previous year in a "big" show, laid but 76 eggs in her pullet year, and was doing still worse in her second year. However, he stated, that this particular hen (a White Leghorn) was "very large, both in body and frame," and showed a foundation on which he was able to build—condition—fake—select your own word, the final structure and appearance which would "catch the eye" of the expert who could judge capacity and production performance from external characters.

Intelligent Breeding Needed

Now, let me repeat—I do not know what proportion of the Utility Exhibitors are using such practices. I do know that the practices are in use, and have been successful in misleading judges, competitors, and visitors to poultry shows. I do know that the practices are increasing in volume, and if certain of these very "conditioners" are telling the truth some of the practices are becoming rather general.

Let me emphasize, also, that I have made this exposure, not as a criticism of the value of external characters in culling the average flock, nor with any idea of discouraging legitimate constructive efforts to increase the production ability of our fowl. On the contrary, I wish we could see a more general use of the trap-nest, and intelligent breeding, being practiced among all of our breeders.

I am convinced, however, that there is no useful purpose served by the so-called "Utility" or "Production" classes in the show room, as at present conducted.

Who ever heard of a "race horse" man showing his horses in a "horse show" to be judged on the basis of

Attention, Farmers!

The U. S. Government recommends the use of fresh, pure crude oil for your hogs, sheep, poultry and cattle, and warns you against impure or processed oils. So take warning and send for "Crudo Brand," guaranteed fresh and pure, and you will never want to use any other kinds. Crudo Oil accomplishes its purpose and destroys the lice that always cause havoc among your animals, and quite often the death of a valuable specimen. You should guard against such losses and use "Crudo Brand" and use it freely about the farm. It purifies, disinfects and is absolutely harmless. Write for our circular, it tells you all about the many usages for "Crudo;" don't delay, as right now is the time to clean up and keep the little pigs and chicks healthy. Don't wait another minute. Send \$10.00 for 50-gallon steel drum of "Crudo Brand" of fresh crude oil. Drums to be returned. We accept personal check. Address

The Nottingham Oil Company,
411 Central Building,
Fort Wayne, Ind.

Special!—Our Formula for making red barn paint for barns, sheds and fences at less than 45c gallon will be interesting to all. It will be sent free upon receipt of your name and address to the Nottingham Oil Company.

GOLDEN CAMPINES

Bred from my pens of Palace and Garden winners. Blue ribbon winners at Madison Square Garden including 1920, 1921, 1922. Hatching Eggs.

Mrs. W. B. Brainerd R. D. Ulster Park, N. Y.

Stier's S. C. Anconas

Those wonderful "Hedgewoods"—Blue Ribbon Winners for years at Chicago Coliseum and Madison Square Garden. Developed for breeders who love "Quality." FRANK C. STIER, The Ancona Specialist. 1107 Nicholson Ave., Lakewood, Ohio. Treasurer United Ancona Club.

speed. He knows, full well, that the race track offers the competitive ground on which he must meet others, and prove performance ability. He knows, full well, that if any man could judge "performance ability" accurately, from external characters, that man could "break" every book-maker in the United States.

You know how impossible it is to judge "performance ability" of Pit Games, in an exhibition class. We can often designate likely looking specimens, but the man who could, by an examination of external characters, determine actual performance ability among a number of Pit Games of close quality, could "clean up" a fortune betting on the results of the Pit Contests (Oh yes! there are still lots of mains being pulled off, in this part of the country).

Just as the race track is the proper place to determine the "performance ability" of the race horse; just as the cocking main is the court of final judgment in determining the "performance ability" of a Pit Game; so is the Egg Laying Contest the public competitive ground on which "performance ability" of egg production should be fought out.

Review of the Standard Committee's Work.

By Frank L. Platt

Continued from page 584)

new breed business. The pork-hog breeders get along on four breeds. The beef cattlemen have three great breeds. The dairy cattle men have four breeds. Great industries in hogs, beef and milk center on those breeds. On the other hand the pigeon men have an unknown number of breeds; no one knows for sure how many. The breeding of purebred pigeons is a hobby, not a livelihood. What course is the purebred chicken business to take? The Standard Committee said: "Let us lay down some rules; let us set up some principles; let us define the policy that underlies standard making, going back to the beginning." Accordingly, a new general introduction was prepared for the 1923 Standard. That introduction states it is one of the fundamental principles of the A. P. A. that: "No more breeds should be recognized than can be readily identified."

That is what defeated the Rhode Island Whites and the Black Giants and the Rose Comb Barred Rocks. The Black Giant men will not admit defeat and are already swinging into action every force they command. Personally, we like the Giant and have been its friend ever since we went into Burlington county, N. J., in 1911, discovered it, and wrote about it.

If you call the S. C. Rhode Island White distinctive in type and admit it as a variety of the Rhode Island breed, then a Red Plymouth Rock will be in order; and if you call the R. C. Rhode Island White distinctive in type and admit it as a variety of the Rhode Island breed, then a Red Wyandotte will be in order. Breeders will be at liberty to exhibit them and if they comply with the constitution of the A. P. A., they can be admitted to the Standard.

The time has come to accept a policy on this new breed business and establish a precedent. You will either accept the recommendations of your Revision Board on Rhode Island Whites, or you will reject those recommendations; you will either accept, by your votes at Knoxville, the policy that your Revision Committee has sought to establish, or you will turn over the Standard to recognition of breeds without end which characterizes the pigeon fancy. The members of your Standard Committee have brought down upon their heads the wrath of two thousand Giant, Rose Comb Rock and Rhode Island White breeders, but that committee was faithful to the principles that it believes should underlie your standard.

The Constitution of the A. P. A. specifically states that the Standard Committee shall adequately protect breed type, and the committee spent a great deal of time in considering the proposed Standards for these proposed new varieties in an effort to render an absolutely unbiased report. The convention can either accept or reject that report; but should the

Is this not distinctive Rhode Island Red type? This is a likeness of the first Rose Comb Rhode Island White pullet at the Plainview, Minn., Show, December, 1921. She scored 95 1/4 and was the champion pullet of the entire show. Members of the A. P. A. will be asked to decide whether the Rose Comb Rhode Island White shall be admitted to the Standard. There are at least 400 breeders of this variety in Minnesota and Iowa, and many more in the southwest. How will you vote? Photo, courtesy W. J. Stephan.

Standard Committee be lax in its examination and play politics in preparing its report, that committee would receive the hearty condemnation of every breeder and fancier, as well as of the poultry press, just as soon as the mix-up of breeds became apparent in the poultry shows.

The Rose Comb Barred Rock was rejected. It was hard for your committee to do this. There was a matter of sentiment involved. There are men and women who have spent years of work on this variety, and they are in the sunset days of life. Your committee would have liked to have seen their efforts crowned with official recognition. Just as the tears of a woman in the south-west were shed in a letter she wrote about the admission of Rhode Island Whites, so the R. C. Barred Rock people touched the human side of your Standard Committee. John H. Robinson in his report of the committee's work has truly said that no Revision Board was ever confronted with such a hard problem in connection with the recognition of breeds.

As one who sat in that committee, we can only say that your committee tried to do its duty, in the light of what was best for the purebred poultry industry of America, now and in future years.

Your committee believed that the rose comb was a breed characteristic of the Wyandotte, and that the single comb belonged to the Rock. If you vote to overrule the recommendations of the Standard Committee, and admit the Rose Comb Barred Rock at Knoxville, you will find a year hence that the Single Comb Silver Laced Plymouth Rock must be admitted, for the breeders of these single comb Silver Wyandotte sports have already filed their petition.

If, as may be likely, the Black Giant Standard is recommended, carrying as it does the same dark eyes, single comb, red lobes, black plumage, and black shanks with yellow bottoms to feet that are now called for in the now Standard Black Java, then there is no right or moral reason why the Rose Comb Rhode Island White standard should not be recommended, carrying, as it does, the same red eyes, rose comb, red lobes, white plumage, and yellow shanks of the now Standard White Wyandotte. The same would apply to the Single Comb Rhode Island White in its relation to the White Plymouth Rock. And, the Rose Comb Barred Rock advocates could say: "Breed characteristics? Tell us what you mean!"

If you admit one, you must admit all, or be inconsistent with yourself and unfair to the new varieties. Personally this writer would like to shut his eyes and vote for these new varieties, but he believes that a principle is involved; and though the committee wrestled with it for hours, it was unable to solve or circumvent it.

Such is the issue and such the argument. Perhaps harder things will be said on the floor of the convention. But let not the champions of Black Giants, Rhode Island Whites and Rose Comb Barred Plymouth Rocks be now dismayed. There has never been a time when a new variety has not been subjected to scrutiny and criticism, yet never

Science Discovers Greatest Lice Killer

Changes Old Methods. No Dusting or Spraying. Birds Delouse Themselves. Gives Lasting Relief.

A recent discovery promises to revolutionize all the methods accepted up to now for keeping poultry free from lice and mites. This wonderful lice killer keeps the birds always lice free without the poultry raiser doing any work. It is the simplest, easiest, surest and best method ever discovered.

Hick's Lice Kill, which is the name of this sensational lice killer, is added to the drinking water. The medicine taken into the system of the bird comes out through the pores and every louse or mite dies or leaves the body. It does not injure the hatchability or flavor of the eggs or meat; is harmless to chicks and does not affect the plumage. A few days treatment at the start and then a little in the drinking water each month.

A Trial Costs You Nothing

So confident is Mr. Hick that Hick's Lice Kill will kill every louse or mite, that he is making a special guaranteed offer of two regular full sized, double strength, \$1.00 bottles and a regular \$1.00 package of Hick's Egg-Lay Tablets all for \$1.00. Use one bottle yourself and sell the other at one dollar, thus getting your own free. Send \$1.00 today (currency, money order, check, etc.) to Chas. M. Hick & Co., Dept. 214, 1018 S. Wabash Ave., Chicago, Ill. If you prefer, send no money, just your name and address, and pay postman \$1.00 and postage on delivery. If after two weeks trial you are not absolutely satisfied, write Mr. Hick and your money will be refunded.

has a new variety, supported by a thousand ardent breeders knocking at the door for admission, been denied entrance. No hand had been extended in welcome, and no voice has been heard to say: "Step thou up here." The thousand breeders below have pushed it up. The case this time is different and the issue vital to the future policy of standard making, for breed characteristics are the issue. But, after all, the history of practical action by the conventions is on the side of the new claimants for recognition. It is easier to poll a two-thirds vote in a convention than it is to secure a majority vote of a small committee.

Spurs.

We are in receipt of a letter from Karl A. Wernle, Illinois, who says:

"I received my American Poultry Journal yesterday and read your article 'Revision Committee Prepares 1923 Standard,' with considerable interest.

"Under the section of 'General Changes' on Page 530 is the following: 'Spurs or Absence of Spurs on Cocks—Are to be Made Defects.' If that applies to triple spurs, I, as a fancier and breeder of Sumatras, wish to register a protest against the adoption of same. According to the oldest breeders of Sumatras, triple (and sometimes more) spurs are considered a breed characteristic and mark the purity of the breed. The old time Sumatra seemed to have had triple spurs even more often than the present day bird. One of the spurs (the center one) is always as fully developed as a single spur on an ordinary bird and the others are located above and below and are usually shorter. As a rule they do not appear until the second year, or until the center spur has reached the length of from one-half to three-quarters of an inch. I have always bred my birds for that feature and it has taken quite a little culling to bring them to the point of reproducing same among the majority of the offspring."

This writer called the attention of the committee to triple spurs on Sumatras. The committee, however, was undecided as to whether multiple spurs were desirable as well as natural. Mr. Wernle's letter indicates that they are desirable and a point he aims for in breeding. We shall be pleased to again bring this matter to the attention of the committee.

Mr. Wernle concludes his letter by saying: "I would also like to see an illustration of the Sumatras in the Standard but that may be asking too much as the birds are probably not bred by enough breeders to warrant such expense." That is a very sensible view to take. The association cannot afford the expense at this time. The committee has ordered \$750 worth of new pictures and alterations in old pictures that will cost probably \$750 more.

Tail Carriage.

The degrees above the horizontal at which the tails of the different breeds are to be carried will be determined later by the committee. It was decided that after the pictures, drawn in accordance with the new Standard text, were finished, the profiles of the tails should be measured in terms of degrees, and the figures should then be inserted in the Standard text. It was found that artist Sewell had measured the degrees on a different basis than Mr. Schilling; and Mr. Schilling was instructed to make a new picture to take the place of Figures 40 and 41 in the present Standard. The degree at which a tail is said to be held depends altogether on how you measure it; therefore, this matter is to be more carefully dealt with in the new Standard.

Symmetry.

A motion was made to omit symmetry from the scale of points, and carried. It was pointed out that symmetry was nothing more or less than the harmony of parts, and if every section were perfect and harmonious within itself, the result would be a perfect and harmonious whole. The vote to drop symmetry was reconsidered, however, and lost. The argument was that the 1915 Standard Committee dropped symmetry and went to a great deal of trouble to rearrange all the scales of points, and then in open convention one member told of a sober army having symmetry and a drunken army lacking symmetry, while another member told of cupolas giving symmetry to a barn, with the result that the convention voted symmetry back into all the scales of points, and the Standard Committee had to remake all of its scales of points. As long as there is a division of opinion on this question of symmetry being given a separate shape valuation in the scales of points, it seemed better to leave the old joker in, lest a whole day's

hard work on the part of a committee of seven men be knocked into a cocked hat by a convention in fifteen minutes.

Capons.

Capons are to be recognized by the Standard. The Kansas City Convention two years ago referred this matter to the Standard Committee, and the Committee decided that capons are as legitimate exhibits in a poultry show as steers in a fat stock show, and every livestock man knows that steers are an important entry, with great interest centering around their class. Therefore, the word capon is to be defined in the glossary as a castrated male chicken which is easily distinguished by undeveloped and pale colored comb, wattles and lobes. In "Instructions to Judges," it is to be stated that capons shall be judged only by comparison, and on the following basis: (a) Quality and distribution of flesh; (b) weight proportionate to the breed; (c) breed type; and (d) breed characteristics. It is realized that the young cockerel that shows stubs or a side sprig or a little off color will be the one that will be caponized, therefore the technical disqualifications are not to apply, and as long as the birds show pure breeding, they should be eligible to win. This recognition of capons on a strictly utility basis, consistent with pure breeding, is a new departure in standard making. It should go a long way to prove that the Standard breeds are not merely built up on "feathers;" it should go a long way to convince the public that all the breeds cannot be built to suit the egg faddists who insist on selecting for high breast bones, with slab sides, that denote the poorest possible type of poultry for fleshing purposes; and the exhibits of capons in the dual-purpose breeds should drive home the reason that the great popularity of these breeds is based on a combination of meat and egg qualities. The apparent effort of some people to Leghornize the dual-purpose breeds by breeding out the broody tendency and selecting the slab-sided birds, has its origin in ignorance of the economics of American agriculture and the place the dual-purpose breeds have in the best systems of American farming.

Judging Eggs.

Chairman Branch was appointed a committee of one to prepare a scale of points and brief rules for the judging of brown-shelled, tinted and white eggs. The committee of forty left this matter in the hands of Professor A. G. Philips, who rendered no report. It was proposed to give a specific standard color and weight to the eggs of each variety, but the Standard Committee was opposed to this theoretical nicety and practical absurdity; however, realizing that the displays of eggs are an attraction in many shows, and judges are called upon to judge the entries of eggs, it was decided to formulate some rules that should govern such judging. To specify, however, that a particular variety of Wyandottes, or Rocks or Orpingtons shall produce a particular color of egg shell is to make a joke of the whole thing. What judge could tell that Minorcas not Leghorns laid the white eggs, or Langshans not Wyandottes produced the deep brown eggs?

Minorca Weights.

The report of the committee of forty called for an increase in all Minorca weights to the level of the S. C. Black variety. This was an error. This writer made the motion in the committee of forty, and was careful to state that it covered the S. C. Buff Minorca variety only. Lloyd C. Mishler appeared before the Standard Committee to protest raising the weights of the Rose Comb Black variety. He stated that a decrease in egg production would follow an increase in weight, and that he was interested in selling the most useful type of chicken. The Standard Committee did not increase the weights of any Minorcas except the S. C. Buffs. After doing this, so many letters of protest were reported by the chairman that the committee became doubtful of the real attitude of the Buff Minorca breeders. The matter was, therefore, reconsidered, and what report the committee will make will depend on the evidence secured between now and the Knoxville convention.

Anconas.

The Standard Committee had its hands full with this variety. Western and Southern breeders have been loyal to the Standard and showing birds tipped one in five. The winners at New York, Boston and Chicago are 80 to 98% tipped. You wouldn't think it to look at them, but when you count the feathers you find the best pullets are close to 80% tipped and the best hens are close to 100% tipped. The reason that nearly every feather is tipped, yet the birds look dark and lustrous green in the ground color, is because they carry a long feather in their

What is the

Best Breed of Poultry

For You to Raise?

Send me your name and address, a postal will do, and I will send you, free, facts that will help you to decide this question. I will send you a booklet that tells of the breed that is the greatest producer of eggs and meat. Also a Bulletin containing helpful and instructive articles on poultry raising. To all who are undecided what kind of chickens to raise; to breeders that are not satisfied with their present breed; to fanciers that want beauty, eggs, meat and profit; to back-lotters and suburbanite poultry raisers who want the best adapted fowl for their purpose; to farmers who want the most profitable breed for them to raise—to all these here's an opportunity to get facts that will help you to succeed with poultry—help you decide which is really the best breed for you to raise. Sick Baby Chicks?

Germozone operates just as these people say. It is preventive as well as curative, and satisfaction is absolutely guaranteed. Twenty years on the market. Sold by drug and seed stores at most towns.

Wm. E. Shepherd, Scranton, Pa., wrote: "Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick." Ralph Wurst, Erie, Pa., "Not a case of white diarrhea in three years." C. O. Petrain, Noline, Ill., "I never had a sick chick all last season." Mrs. Wm. Christians, Olive Ridge, N. Y., "Have 800 chicks now 5 weeks old and not a single case of bowel trouble."

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock—for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers.

Co-Operative Poultry Farms, 3148 Sutton Ave., Maplewood, Mo. Baby chicks, setting eggs, breeding stock. Barred and White Plymouth Rocks, S. C. B. I. Reds, S. C. White Leghorns, White Wyandottes, White Orpingtons.

back that has much room for the greenish black; and this feather narrows at the point, so the white tip, even though it extends clear across the point of the feather, is very small. It is the character of the feather that influences this color type. Where a round, short feather is bred, the white tips are much larger, and one in five of these tips makes about as light a bird as wins in New York or Chicago where there is more tipping, but the white tipping is neater and smaller in proportion to the black ground color. The Standard Committee, therefore, settled on one feather in two in the female to be tipped, except on the head, where one feather in three is to be tipped. The schedule adopted for the male was one in two on breast and one in three on hackle and saddle; but in the careful review of its work, the committee found that this one in three in hackle and saddle was inconsistent. While the avowed intention of the committee was to draw up a standard for a Mottled Ancona, not a Black Leghorn with a few white flecks, it found that it was going backward, for the 1915 standard called for every feather of the male's saddle to end in white tips. The matter was, therefore, again reconsidered and the committee now recommends one tipped feather in two on female neck, back, wing bows and breast; one tipped feather in two on male neck, saddle, wing bows and breast. The back of the male is to be tipped one in five. The heads of both sexes, one in three. We hope that some of the breeders who have been showing at New York and Chicago Coliseum will ship some birds to Knoxville so that convention may see that this new description is, after all, exactly what the breeders want, and some breeders already have. Some breeders may feel that they are going to have a hard time to hold sound wing flights with a one in two tipping, but this does not appear to be the case when the right shape or character of feather is bred. In the preamble to this breed, which was rewritten, it states that a clean, well defined, neat white tip is desired, and the even distribution of tipping over the entire plumage as seen by the eye is more desirable than the counting of the feathers. The lobes of Anconas are to be white, the same as other Mediterranean varieties. "White or creamy white" is indefinite and allows more latitude than a "Standard of Perfection" should grant. The same with shanks: "Yellow or yellow mottled with black" is not a specific requirement. "Yellow" shanks are really the ideal; therefore, the standard committee confined its descriptions of shank color to the ideal, "yellow." Yellow shanks are required on Black Leghorns and Black Wyandottes; they should be more easily secured on Anconas, for white is allowed in their plumage. The committee recommends that Anconas more than one pound underweight be disqualified.

Red Sussex.

The original motion was to give this variety a red under color. This writer did not vote on this question, feeling that he should abide by the decision of the committee. If he had voted he would have tied the vote. We got to thinking about the matter after the vote was cast, and decided that we owed it to the breeders of this variety to express an opinion. The committee permitted this question to be reconsidered and voted to allow a bar of slate in the under color. We believe this is right and proper. Slate under color as called for in the present standard is too strong a dose of black; it breeds black ticking in the females and black spangling in breasts of males. More red is needed; however, for the pendulum to swing to clear red is too long a stroke considering the history of the variety which records slate from the earliest records. We believe the committee acted wisely in reconsidering this matter and adopting a red under color with a bar of slate.

Barred Rocks.

The secretary of the Barred Rock Club has publicly stated that the A. P. A. convention at Knoxville, Aug., 1922, would vote on the club's two variety standard for Barred Rocks. This is an error. It arises from the club secretary assuming that a standard prepared by a club must be submitted without change, by the Standard Committee, to the convention. This is not a fact in this case, for the chairman of the Standard Revision Committee has ruled that the Barred Rock Club's standard calls for a recognition of two varieties of Barred Rocks; therefore, according to the constitutional provisions covering the recognition of new varieties, the club's standard cannot be acted upon until one year from August, 1922. Moreover, the Standard Revision Committee unanimously voted not to recommend two varieties of Barred Plymouth Rocks. To override this veto will require a two-thirds vote of the entire 1923 convention. A two-thirds vote is always hard to secure, especially when the issue is clean cut and there is strong opposition.

It Costs You Nothing To Prove the Value of Semi-Solid Buttermilk

Every poultry breeder, large or small, can now try Semi-Solid at no expense. Prove for yourself that it eliminates diarrhea, builds vitality, makes your chicks grow faster. Demonstrate that you get your broilers on the early high market. Cut down your culls. Increase your egg production.

Make These Tests Yourself

Semi-Solid is the only form of manufactured buttermilk that can be returned instantly and permanently to the original buttermilk. No other buttermilk is as palatable.—Watch your chicks eat it. Contains the most natural milk lactic acid—nature's healthifier and tonic. Semi-Solid fed birds always have larger egg laying organs. You get more eggs.

We Take All the Risk

Because we know Semi-Solid is best by test, Prof. Lewis proved it. Leading commercial poultrymen buy Semi-Solid in ten barrel lots. Poultry fatteners—THE MEN WHO HAVE TO SHOW A FEEDING PROFIT buy it by the carload. Once you use it you will never be without it.

Fill Out the Coupon

and attach a one dollar bill. We will send you postage prepaid our eight pound can of Semi-Solid. Use it—if you are not satisfied your money will be immediately refunded. Furthermore, on receipt of your next order for either the quarter barrel or the regular 50 gal. barrel YOUR DOLLAR IS DEDUCTED FROM THE REGULAR PRICE. Don't Delay—Start Today using Semi-Solid.

We guarantee one pound of Semi-Solid Buttermilk equals one pound of dry buttermilk in feeding value.

How to Feed Your Chicks

You want your baby chicks and growing stock to grow into strong, healthy fowls, as quickly as possible. Many beginners try to accomplish this by overfeeding, especially when grain prices are low as at present. Such haphazard methods are fatal to success. Poultry raisers must learn to understand feeding. Learn how to feed at the right times of day, in the right way and in proper proportions. Don't experiment. It's costly and unnecessary. Get and use methods that experts have tried and proved successful. A good book to read is "Dollars and Sense in the Poultry Business," by Prof. T. E. Quisenberry, who has made a specialty of baby chick problems for 25 years. You may have a free copy of this 96-page book by sending a post card to the American Poultry School, Dept. 2063, Kansas City, Mo.—Advertisement.

THE G. E. CONKEY CO. 6531 Broadway, Cleveland, Ohio

It appears that the Barred Rock will continue to advance under the same standard that has been in force these many years—a standard that was drawn up by the greatest Barred Rock breeders who ever lived.

The Standard Committee has decided to include a detailed reference to the pullet-bred male and cockerel-bred female in the preamble to the breed. This is done to meet the clamor for some reference to these two breeding birds. It seems to be necessary to do something of this kind at this time, but in the judgement of future years we are not sure that it will prove to be a thing wisely done. It is pretty hard to write a description for a breeding bird. You might see a beautiful Light Brown Leghorn male, but before you bought him as a breeding bird, you would want to know what his dam and sisters were like.

Several years ago this writer judged the Barred Rocks at the Washington, D. C. show. R. J. Waldon won 1st, 2nd and 3rd on three beautiful, snappy barred pullets. He also won 1st and 4th pullet bred cocks. After the judging he asked us what we thought of the 4th pullet bred cock. We replied: "He has no underbarring at all." Then Mr. Waldon said: "I have sold better looking ones for \$5; but I paid \$35 for him and he is the sire of the pullets which you have placed 1st, 2nd and 3d." Friends, there is something else besides "looks" in a breeding bird, and that "something else" is pedigree.

Single Mated Dark Brahmas.

F. M. Prescott of New Jersey, asked the Standard Committee to allow white mottling on the breast of the Dark Brahma male. It is true that some of the best pullet breeding males have weak colored breasts. But, no breeder would select a male for the purpose of producing good penciling in his female progeny, simply on the strength of a mottled breast. He would first want to know if that male was out of a well penciled female. Looks are not infallible indications of pedigree.

It seems like going backward to standardize a mottle-breasted male in Dark Brahmas and Silver Penciled varieties. If such a thing were done, and Mr. Prescott, Newton Adams or Dr. Lott should walk into the Garden show, their comments on the birds would be more uncomplimentary than what Mr. Prescott wrote about the last Garden show.

The breeding proposition is important. But the Standard must set an ideal, and the material used in producing that ideal, while valuable to the point of being indispensable in the breeding yard, cannot always be "standardized." To do so would result in lowering the standards in many instances. It is to be expected that commercialized breeders, hatcheries, shows and publications will continue to clamor for standards that will make it possible to sell every kind; no culling being necessary, only grading from low priced to high priced grades required on the part of the clever salesman. That is a condition that must be met more and more as the poultry industry grows bigger and bigger; and those who seek to preserve the high ideals of the past, must expect to meet the strongest opposition, supported by the most alluring arguments.

It is our opinion that the breeding proposition in Silver Penciled varieties was met as fully as possible by the Revision Committee. The male is to be allowed some white in the lower feathers on the sides of his body. He is to have a slate undercolor that shades light at base; and under this rule the male whose under color of neck and saddle stops short of a pure, positive white will not be defective. Such a concession has not before been made in the Standard. The 1905 Standard called for a black or slate undercolor in male. The Silver Penciled female is to have distinct penciling in her neck, it being realized that penciling is the first property of the female. The problem is no longer aggravated by insisting on a striped hackle in the female.

The ground color of the female is described as gray in the present Standard. We all know that the whiter the ground color the better the bird. The Standard Committee, therefore, adds a separate clause calling for contrast between the ground color and the black pencils. The committee then changed the ground color from "gray" to "steel gray." We believe the breeders will want a cleaner, whiter ground color than "steel gray." It is now for them to suggest the term. If the Standard Committee had not made some change from the word "gray," the matter could not be finally corrected at the Knoxville meeting. Action there can only be taken on the recommendations of the committee; whole standards cannot be written at Knoxville.

It rests with the breeders to name the kind of ground color they want in the Silver Penciled female.

How To RAISE BABY CHICKS

Put Avicol in the drinking water

Most people lose half of every hatch, and seem to expect it. Chick cholera, or white diarrhoea, is the cause.

An Avicol tablet in the drinking water will save your chicks from all such diseases. Within 48 hours the sick ones will be lively as crickets.

Mrs. Wm. May, Rego, Ind., writes "I was losing 10 or 15 chicks a day from diarrhoea before I received the Avicol. I haven't lost one since."

It costs nothing to try Avicol. Use it either for preventing or treating white diarrhoea and all bowel diseases of poultry. If not satisfied, your money will be promptly refunded. Sold by most druggists and poultry remedy dealers, or mailed postpaid for 25c. Burrell-Dugger Co., 407 Columbia Bldg., Indianapolis, Ind.

SUCCESS means raising 99 per cent of your Baby Chicks to maturity. Why not do this with a

Success Electric Brooder Heater

and turn your losses into profits. Use your own brooders and just attach heater under cover. No smoke—no odor—no dirt—safe and economical.

Pin a \$2 Bill to this Advertisement and we will ship one parcel post prepaid at once. State whether 110 or 32 volts. Dealers territory open—write or wire.

AMERICAN FUR BREEDER Monthly zine. Tells about breeding Foxes, Mink, Skunk and other fur animals. \$1 a year. Sample copy 10c. American Fur Breeder, Box 922 Eminence, N. Y.

The committee realized that the Standard has worked a hardship on this beautiful and wonderful color-type. The Standard has been materially altered, as above. It is now up to the Silver Penciled breeders to write E. C. Branch, Chairman, Lees Summit, Mo., endorsing the changes made in the male, and stating precisely what is wanted in the female ground color; otherwise do not be disappointed with whatever action may be taken by the Knoxville convention.

R. I. Red Female's Neck.

The report has gone forth that the Standard Committee eliminated black ticking from the lower hackle feathers of the Rhode Island Red female. The fact is, this particular vote was reconsidered, and the ticking of the female was left as in the present Standard. Considerable was said on this subject. The argument which prevailed was that the Standard calls for a black tail and as much black in the wing flights as is carried by a Brahma and it is unreasonable not to allow the rudiments of striping in the lower neck feathers.

The other side contended that if you allow it in the female, you should allow it also in the male; that R. I. Red males, particularly cocks, already carry ticking in their lower hackle to considerable extent, and the only way to clean up those necks is to get the ticking out of the female neck. Then the red color question came up. It was said that the Reds are becoming too dark, and to take the black out of the neck would help to bring about a brighter red color. The fact is, a neck that carries a positive black stripe may be of an orange color. Striping or ticking has nothing to do with the ground color of the neck. The vote was therefore reconsidered and the ticking in the lower hackle feathers of the Rhode Island Red female is left as in the present Standard.

Considerable discussion arose over the proper shade of red. The Standard is very elastic on this point, calling for a "rich brilliant red" which may be of almost any shade desired by the judge. It looked for a time as if the shade would be described as a "deep claret" color. However, Mr. Robinson brought in a color-card and it was found that this word description would not fit. The red color was, therefore, left as in the present Standard, but the preamble to the breed was rewritten to call for an even red color not so dark to have a brownish or violet hue. Some of the birds are so dark that they have a purple or "blue vitrol" color, others are a flat brown. The Standard Committee believed that neither of these were in keeping with the Standard requirement of "rich, brilliant red."

Columbian or Light Brahma Color

The present Standard calls for bluish-white undercolor in the breast of the Columbian and Light Brahma male and female. The Revision Committee made the undercolor bluish slate in all sections.

The present standard calls for the two top main tail feathers in the female to be black, laced with white. On account of the tendency toward white sickles in the male's tail, the Columbian Wyandotte Club asked for solid black main tail feathers in the female. The committee agreed that completely laced top main tail feathers was too extreme, so decided to call for slight edging of white on these two top feathers.

We are also going to quote the exact language adopted for the back and saddle of the male. This section has been argued for years. We believe that the committee adopted the best word description ever applied to this part of the male. The new text is: "Black, surface color white; cape black and white; saddle white, except lower saddle feathers extending from points of wing to root and sides of tail which should be white with a very narrow 'V'-shaped black stripe at end of each feather tapering to a point near its lower extremity; this 'V'-shaped stripe increasing in width, length and density as it nears the tail coverts."

That does not call for a striped back, neither does it call for a striped saddle; it simply calls for a little V-shaped ticking in the long, lower saddle feathers. That is desirable from a breeding standpoint; moreover, it gives finish to the male's color-type, and allows the saddle to blend harmoniously into the laced tail coverts. Such a description is badly needed as the following will indicate:

The illustration on page 584 shows four feathers from four Columbian males. The long feather on the left is reproduced from page 283 of the Wyandotte Standard, published by the A. P. A. The reader of that book is informed that it is a saddle feather. That is a mis-statement. It is a lesser tail coverts that grow from beyond hips, near tail. The second feather from the left in the illustration on page 584 is also from the Wyandotte Standard and is said to be from the back of a Columbian male, which is recommended as the type to use in produc-

Mrs. Ortseifer, East Liberty, Pa.

"Didn't Lose a Chick"

Mrs. S. J. Ortseifer Tells Why She Has Had Such Remarkable Success

"There IS Money in Poultry—when you KNOW how—" says Mrs. S. J. Ortseifer, East Liberty, Pa. "and the National Poultry Institute HAS SHOWN ME HOW TO PROFIT FROM POULTRY more than I thought was possible."

"BEFORE I HEARD OF THE National Poultry Institute," continued Mrs. Ortseifer, "I had poor results with my hatches, but after following your instructions on incubation I quickly saw what to do; I did it—WITH SUCCESS. My chicks used to crowd in the brooder, and I lost a number that way, but your lessons showed me how to prevent this. In fact, from our last hatch WE DID NOT LOSE A CHICK."

"IT IS WORTH A GREAT DEAL TO KNOW HOW TO FEED CHICKS and handle them for early maturity and high egg production, and your lessons have shown us how to do this—to our profit. We get more eggs now, our feeding cost is lower and we have a fine flock of White Wyandottes."

"WE BUILT A NEW POULTRY HOUSE, according to your plans, and I wish you could see our happy, contented fowls, busy scratching, singing and laying. The care of the flock is a REAL PLEASURE; it takes household cares and worries off my mind. My husband has become so interested we are now looking for a few acres where we can raise poultry by the hundreds. WE FIND POULTRY PAYS; AND WE OWE IT ALL TO THE NATIONAL POULTRY INSTITUTE."

ing exhibition pullets. That is another piece of mis-information. A male with a heavy black stripe of that kind in his back would produce pullets full of black in their backs. The Standard states that black spots prevalent in the back of the female shall disqualify her. Why recommend a striped back for a pullet breeding male? It is nonsense. This writer wrote the chapter in the Wyandotte Standard on mating Columbian Wyandottes, and the editor of that book spoiled the chapter by injecting the picture of that feather in it, for never would we recommend using such a stripe-backed male to produce pullets. The third feather from the left on page 584 is reproduced from page 282 of the Wyandotte Standard. It illustrates a feather from "an exhibition male's saddle." Nonsense again. No Columbian or Light Brahma judge would tolerate such a feather as representing a model saddle, or even a good average saddle. The saddle feather that is wanted is the one illustrated on the extreme right, page 584. There you have the V-shaped stripe, terminating in a point near the lower extremity of the feather; you have the pure white center, as desirable in an exhibition bird as in a breeding bird; and you have the bluish-slate under-color.

Some ten years ago we judged the Light Brahma Club show in Philadelphia. The first cockerel had lower saddle feathers marked with this V-shaped stripe. He was taken into the Columbian Wyandotte Club meeting, which was held during that Philadelphia show, and since then Ralph Woodward, Harvey Wood, Chas. Balch, Hendrickson, and other progressive breeders have been asking for that V-shaped stripe. Some breeders in the West have said: "Don't get the backs striped; beware of those eastern fellows." Frank Johnston was present at that Philadelphia meeting and he knows that that V-shaped stripe in the lower saddle does not make a dark bird. Gentlemen, if you will accept that V-shaped stripe as described in the Standard Committee's recommendation you will have a beautiful male, one you can breed to advantage; and you will eliminate the danger of such ignorance as is displayed on pages 282 and 283 of the Wyandotte Standard.

The picture of the Columbian Wyandotte male on page 88 of the present Standard of Perfection, illustrates the ticking in the lower saddle as described by the committee. The Light Brahma male's lower saddle does not meet this description, moreover the illustration is faulty in other respects, and the committee authorized artist Schilling to make a new Light Brahma male illustration; also to cut off a little of the Langshan type in the Dark Brahma male.

Earlobes, Shanks and Undercolor

All breeds in the American class are to be given the same lobe disqualifications as applies to Plymouth Rocks, which is, any enamel white in lobe shall disqualify the specimen. Perhaps there are some breeders who will object, but the committee feels that all breeds in the American class have outlived the formative period. If any enamel white in lobes has been a good disqualification for Plymouth Rocks, it will be an equally good disqualification for Wyandottes and Reds. Of course, there is the other side. It was stated in the American Fancier, March 17, 1897, as follows: "I do not think a little white the size of a pin head in a Plymouth Rock earlobe should disqualify a way-up specimen, and allow a poor lop-sided, long-backed specimen by the side of him that happens to be free from this defect to win a premium over him. There are a lot of places where judgment must be used in order to make judging of poultry what it should be."

No one of today would go back and tolerate white in the lobes of a Rock. Should not the other breeds in the American class be promoted to the same high level?

Shanks and undercolor are the stumbling blocks in a number of varieties. It is difficult to get yellow shanks in Anconas, Part-ridge and Silver Penciled Wyandottes and Rocks, Black Wyandottes, Black Cochins, etc. Yet, in each of these cases, yellow shanks are a breed characteristic. The Barred Rock men, with considerable black pigment in their birds, get yellow legs. Then why not the other breeders? So yellow shanks were adopted for the above named varieties, and it will be up to the breeders to pay more attention to color of legs and toes.

Earnest effort was made to handle the undercolor problem in a sensible way. Black pigmented fowls with black shanks, such as Langshans and Minorcas, are to have dull black undercolor. Black plumaged fowls with yellow shanks are to have slate undercolor, which may run to light slate in old cocks and not be defective. Varieties carrying considerable white in their plumage, such as the Silver Laced and Silver Penciled Wy-

TOWA MODERN APIARIES, Box 7, Waterloo, Iowa

dotte males, are to have slate undercolor that shades lighter at base of feather.

Leghorns

The underline of the Leghorn is to be mentioned, which reference with the $\frac{1}{2}$ pound increase in Leghorn weights, and the new disqualification clause of more than 1 pound underweight, should tend to impress on breeders the fact that substance of body is important in this breed. There is no assurance that these recommendations on the Leghorn will be adopted. There is a large number of little, topky birds in the country, that look good to their many owners, and they may out number those who know that the utility Leghorn has size and the winners at the Chicago Coliseum and new York shows have size, substance and under line as well as top line.

Complete new illustrations are being made for Leghorns, similar in outline to those made by Artist Schilling for the Brown and White Leghorn Clubs. The back of the Leghorn female, instead of rising in a "concave incline to tail" is to rise in a "concave sweep to tail." The Silver Leghorn men asked for more green sheen in the color of their male, which was granted. White ear lobe color that leaks slightly into the side of the face is not to be termed "white in face" and disqualify. It appeared that some judges were too harsh in applying the old disqualification clause.

We are in receipt of the following letter from H. J. Muschewski, Iowa:

"In your report of the Revision Committee's work, under the caption 'Leghorns' it reads thus: 'The Browns are to be recognized in three varieties only; S. C. Dark and Light, and Rose Comb Brown only.' Now I don't quite understand this last phrase: 'Rose Comb Brown only.' Does this mean that the Rose Comb breeders will not have the same fair chance in exhibiting their birds as Light and Dark Browns as the Single Comb breeders will have? Will it force us Rose Comb breeders to mate our birds under the ancient double mating system in order to exhibit both males and females? If this is the case, it will work a hardship on us and will hinder us in popularizing our variety."

The Standard Committee does not recommend that the Rose Comb Brown Leghorns be recognized as Light and Dark. The Rose Comb Brown breeders have not petitioned the Association for the recognition of their pullet bred male and cockerel bred female. The committee, therefore, was unable to take up this matter even though it had been disposed of to do so. The sense of the committee was unfavorable to splitting up any other variety until the S. C. Brown breeders had had more time to demonstrate the way the Light and Dark proposition was going to work out. Theo. Hewes and this writer were both favorable to Light and Dark S. C. Brown Leghorns, when that issue was fought out three years ago, but from reports that reached the Revision Committee, from both the east and the west, it would appear that the dark line is growing darker, with black shawls around the lower hackles of many of the males, and the light line was not showing the quality that it should.

Orpingtons

The White Orpington Club asked for a number of changes in the wording of the Orpington Standard. D. E. Hale appeared before the Committee and said that the trouble was more in the judges than it was in the present Standard of Perfection. After going over the proposed Orpington Standard, it was found that the club had asked for more changes in wording than of meaning. Some of their wording was not in harmony with the language of the Standard. The Committee granted the incline to tail in the female which takes the place of the "concave sweep to tail" in the present Standard. The club asked that the body feathers cover from view not more than $\frac{1}{4}$ of the shanks of the male, or $\frac{1}{3}$ of the shanks of the female. As this might tend to indicate that the breeder should make these measurements, in which case the long-shanked bird would have an advantage, it was decided to put these fractions in the preamble to the breed, supplementing them with the statement that these proportions should not be obtained by breeding shanks longer than called for in the Standard text. The old preamble was rewritten and breeders were cautioned to maintain Standard type, and warned that massive-ness should not be obtained by extreme Coching feathering; that the "sides of the body, sometimes erroneously referred to as the fluff, should be moderately smooth, with full, not profuse feathering."

Golden Wyandottes

Melvin F. Uphoff, Secretary National Golden Wyandotte Club, writes:

"Am mighty glad to see the recommendation for a richer ground color and my class

How to Raise Finest Chicks

The real satisfaction-giving youngsters, that grow steadily and rapidly from the time they kick their way out of the shell until they are ready for market, the laying house or the exhibition cage. That's the kind you should have—can have if you will keep up chick-health and chick-vigor.

First, give them a strong start. From the first meal feed

Pratts Buttermilk Baby Chick Food

Then they are sure to grow, to develop strong, well-fleshed frames and abundant plumage, because this remarkable "baby food for baby chicks" contains exactly the food-elements that make muscle, bone and feather, with scarcely any indigestible fibre. Buttermilk in liberal quantity and finest quality. It saves chicks—raises chicks—prevents loss—brings the profits.

Then keep the youngsters growing. From weaning age give

Pratts Poultry Regulator

in the regular ration. The guaranteed tonic and conditioner that growing chickens need to assist digestion and build up health—to increase vigor and vitality—to bring them safely to early maturity. Try this combination of chick feed and regulator at our risk. Save money! Buy Pratts Poultry Regulator in 12- or 25-lb. pails; 50- or 100-lb. bags.

"Your Money Back If YOU Are Not Satisfied"

A dealer near you will supply both.

PRATT FOOD CO., Philadelphia, Chicago, Toronto

The answer to rapid growth and heavy egg production—Pratts new Growing and Laying Mash and Scratch Feeds

PRATTS 50TH YEAR OF SERVICE

Distinctly outstanding in Genuine Orpington Type, soft rich golden coloring, and Standard Station.

EGGS—CHICAGO COLISEUM QUALITY MATING, \$6.00 for 15; \$11.00 for 30; \$33 for 100.

STANDARD MATINGS, \$3.00 for 15; \$5.00 for 30; \$15 for 100. Infertiles replaced free. Here is a Big Golden opportunity—so order NOW!

WYANT BROS. Route No. 8 Thorntown, Ind.

Buff Minorcas

More winners are hatched after May 1st than before. Quick development and better color in late hatched chicks are the reason. All \$15 Exhibition Mating Eggs NOW—\$7.50 per 15; \$14 per 30; \$22.50 per 50. Quality Mating Eggs NOW—\$3 per 15; \$5 per 30; \$8 per 50; \$15 per 100. Baby chicks 50c each; \$22.50 per 50; \$40 per 100. Mating List Free. EDW. F. SCHMIDT, HAZELRIGG, IND.

Bickett's Barred Rocks

All eggs after May 1st, at one-half price. From best pullet mating, \$4.00 per 15; from our quality farm range flock at \$1.00 per 15, or \$5.00 per 100. Remember our birds win at Chicago, Indianapolis and Dayton, Ohio, shows. Send for mating list. LEIGH W. BICKETT R. R. 9, XENIA, OHIO

Otto White Orpingtons

Eggs reduced to half price—\$3 and \$5 per 15, after May 10. Plenty of time to hatch some grand breeders and winners for the late shows. WM. N. OTTO 5425 College Ave., INDIANAPOLIS, IND.

The Cause of White Diarrhea

White Diarrhea is caused by the bacillus *Bacterium Pollorum* transmitted through the yolk. There is scarcely a hatch without some infected chicks. The germs multiply very rapidly and one infected chick may infect the entire brood. The germs can be killed by the use of preventives. Intestinal Antiseptics to kill the germs should be given as soon as the chicks are out of the shell. It is much easier to prevent than it is to cure.

How to Prevent White Diarrhea

Dear Sir: I have raised poultry for years and have lost my share of little chicks from White Diarrhea. Finally I learned of Walker's Walko Remedy for this disease, so sent for two 50c packages to the Walker Remedy Co., Dept. 646, Waterloo, Ia. I raised over 500 chicks and never lost a single one from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor—they develop quicker and feather earlier. I have found this company thoroughly reliable and always get the remedy by return mail. Mrs. L. L. Tam, Burnetts Creek, Ind.

Don't Wait

Don't wait until White Diarrhea gets half or two-thirds your chicks. Don't let it get started. Be prepared. Write today. Let us prove to you that Walko will prevent White Diarrhea. Send 50c for box on our guarantee—money back if not satisfied. Walker Remedy Co., Dept. 646, Waterloo, Ia.

2 Sy-fon Chick Fountains and 1 Chick Feeder \$1.00

Biggest Value Ever Offered

Sy-fon Fountain—safest, most sanitary, most convenient to use. Fits any mason jar. Doesn't screw on; fastens to inside with brass spring prongs. Easily attached in two seconds. Only Sy-fon Chick Fountain on market. Two holes in bottom—yet doesn't leak—admit oxygen constantly so water is always fresh. Same water level always maintained. Nothing to get out of order—nothing to break. 20 cents each; 3 for 50 cents; 6 for \$1.00. Postpaid.

Columbus Chick Feeder

Has two compartments. Wires smooth jointed.

Combination Offers

2 Fountains, 1-11 inch Feeder, \$1.00.

4 Fountains, 1-20 inch Feeder, \$1.50.

20 inch size, \$1.00, 2 for \$1.95.

THE OLD RELIABLE LAMBERT'S DEATH TO LICE

Insures Clean Fowls—Larger Profits

It has been the Standard Lice-Killer for over 30 years—the standby of Successful Poultry-keepers. Easily used, absolutely safe, sure and quick in results. Most economical because it goes farthest. Try it and see young fowls grow faster and hens lay. Prices \$1.00, 50c, and 25c per Package. Sample 10c. Head-Lice Ointment 25 and 10 cts. per box. If not at your dealers, send direct, including postage for mailing. Address

THE KLEIN-LAMBERT CO., 515 Traders Bldg., CHICAGO

show that a majority of the larger breeders are much in favor of the change. The Standard Committee took another long step in advance when it suggested red at base in under-color, for the best exhibition and breeding males are so marked. I would suggest "golden tinge at base," instead of "red." Believe this wording would be more in keeping with the general phraseology of the Golden's color description."

Spanish

That ribbon-like wattle and a face which is good when it is long, better when it is longer, and best when it is longest, is not the Standard Committee's conception of Spanish welfare. The Committee prepared a new preamble to the effect that the face should not be subjected to abnormal development, but should be developed to attractive proportions. A number of communications from Spanish breeders were read, but the following eloquent appeal from Clarence Hewes brought the vote:

"The White Faced Black Spanish breeders of America have no specialty club nor other organization through which to present to your committee their wishes and suggestions concerning changes in the forthcoming edition of the American Standard of Perfection. Therefore, I address you thus as an individual as I believe you would wish.

"I attach hereto a list of suggested changes in the present Black Spanish Standard and have tried to make these suggestions definite and specific. I would like to present here briefly the reasons for these suggested changes that your Committee may understand my attitude and weigh my proposals in the light of your experience as poultrymen and your acquaintance with the history of Black Spanish, particularly during the last thirty years.

"During the active lifetime of the present generation of poultrymen, Spanish have been bred to a Standard which placed great emphasis on the size of the face. To develop a fowl's face beyond a reasonable extent is to render this section first distinctive, then novel, then abnormal and finally grotesque, and such development can only be obtained by a closeness of selection in the breeding yards that can but result injuriously to the health and stamina of the fowl. Extreme development of novel and distinctive characteristics imposes an undue burden on practical qualities. Such development of any quality can only be obtained by subordinating in the effort every other quality. If success is reached in such effort the result is a one-sided, freakish creature. To saddle onto a Standard bred fowl an abnormal development of one distinctive trait is to emphasize that trait to exaggeration and to render less valuable and less noticeable every other trait.

"After several decades of observing Spanish bred to excessive size of face, the poultry public has wellnigh forgotten that this breed ever possessed any other claim to distinction. In their minds the Spanish exists as an ultra-fancy breed, made novel and grotesque by extreme development of the large, pendulous face. That Spanish have a century old reputation as prolific layers of superior eggs is a fact that has been obscured by the giving of too much consideration and too much publicity to the fostering of a purely incidental characteristic.

"The white face must always remain a distinguishing characteristic of the Spanish. Sensibly and conservatively preserved it should always be a trade mark of pure Spanish blood, but it need not, and should not be encouraged in its development beyond a point consistent with genuine beauty and sane breeding practices.

"I would much prefer to see the emphasis placed on purity of color of the face, and smoothness of texture of the face, since these are qualities of the face that stand for real beauty and are consistent with other standard and useful qualities. Extremely large faces are actually a burden to Spanish males as I am sure every one of your committee has observed; they can only be kept in condition by special care and attention, and instead of being attractive are more nearly ridiculous; they are a tribute to the patience and breeding skill of the man who produces them and nothing more. The large face is so palpably developed as an oddity and novelty; it is so plainly void of any quality of usefulness; and is so extreme in its development that the average poultryman is inclined to place the Spanish with the ornamental rather than the useful breeds.

"On the other hand, picture a face of medium size, pure white in color, smooth in texture, placed in contrast to jet black plumage and coral red comb. Place a value on the face that gives it its just due and no more. Let the development of other qualities be encouraged, and can we now again make Spanish real beauty features of our shows around which we Spanish breed-

Light and Dark Brown LEGHORNS

Buy some of my choice Single Comb Brown Leghorn eggs for hatching and raise some winners and layers. Price of eggs from mated yards are \$2.00 to \$10.00 for 15, and from range flock \$1.50 for 15, and \$8.00 for 100. My strain originated mostly from Tormohls and Grove Hill's best birds and are surely fine. Baby chicks for sale also. John W. Moore, R. F. D. No. 1, Dept. M., Poplar Bluff, Mo.

CHICKS WITH PEP

Our bred-to-lay and exhibition chicks will pay you. Try then and be convinced. Rocks, Reds, Leghorns, Wyandottes, Anconas, Minorcas, Orpingtons. Safe delivery guaranteed. Prepaid. Prices right. Free Catalog. Holgate Chick Hatchery, Dept. A., Holgate, Ohio.

ers can congregate and discourse concerning the beauty and usefulness of our favorites? For more than thirty years clauses have been written into the Standard text making large faces practically obligatory in exhibition Black Spanish. During that time the breed has steadily decreased in popularity until even in our largest and foremost shows an entry of Spanish is a rarity, and on the farms and among the lay poultrymen Spanish are not seen in a month's travel and are only referred to "as a breed we used to have when I was a boy."

"Spanish have suffered in hardiness and vigor as a result of the long continued selection and breeding for extreme face development. It is my experience that this belief is well founded and that the breed is in need of rejuvenation; that it needs a period of wide-open breeding for vitality and vigor, unhampered by any extreme standard requirements. I believe that a revised Standard that places a premium on a well balanced, vigorous appearing bird, that places on face the only value necessary to preserve that character as one and only one Spanish requisite, will work to the vast practical improvement of the breed, and will in a few years result in the production of Black Spanish that excel any we have ever seen in real genuine beauty, a beauty that comes from the possession of physical qualities that we associate with health, vigor and usefulness."

"The present Standard scale of points contains no allowance for valuation of the Spanish face, and in absence of any such allowance, judges and breeders have borrowed from all sources all the valuation they thought necessary to give face the dominant position among Spanish qualities that it has had during many years past. Face and lobes are so plainly one and the same section in this breed that I consider it surprising that the proposal has not been previously made to link these two sections together and I make this suggestion here that these two sections be made one and be given a definite allowance—an allowance that is ample and yet one that plainly and clearly limits the valuation to be placed on face."

Cornish

Fred H. Bohrer, Secretary of American Cornish Club, writes:

"Personally, I feel that the attitude of the Standard Committee on Cornish shape is O. K. and believe that for the future welfare of the breed that we must come to it; however, I know that there are a great many fanciers of the breed who will maintain that we are putting the breed back where it was 10 to 15 years ago, when long-legged, sparrow-bodied birds were common; but this past year, both at New York and Boston, I found the bulk of exhibitors and lookers-on more firmly convinced that something must be done to bring about that "graceful" type in Cornish."

"The greatest opposition will come from the old time breeders, I fear. It is the younger breeders who seem to care to make the breed popular, and who are not satisfied with that sluggish type which we know is detrimental to satisfactory egg production."

"If possible I am going to get to the Knoxville convention in August. I thank you kindly for all you are doing in behalf of the breed and assure you my support as I know that you are a believer in making the beautiful useful and useful beautiful."

The changes made by the Committee in the Cornish Standard will not affect one percent of the birds of today. The birds that it will affect are the low set, azeel-type birds which are mostly imported from England at long prices. The big, strong, broad shouldered, heavy breasted bird will win. Of course, some will say: "You will ruin the breed"; just as some said eight years ago: "If you put the Cornish in the English class they will be bred with the long feathering of the Dorking and the Orpington." However, the long feathers have not materialized. Neither will the slab-sided bird appear as a result of the Standard Committee's recommendations on Cornish.

Poor Hatches.

Many reports indicate that the fore part of the 1922 hatching season has not been favorable to good hatches. With May 1st, we enter the middle of the season. Up to this time the weather has been backward, but now we can count on more favorable hatching and rearing conditions. Nearly half, and perhaps more than half of the best birds of the year will be hatched in May. Because of the campaigns of the U. S. Department of Agriculture, and the State Agricultural Colleges, to hatch early, the egg-buying season has been set ahead two weeks. The May issue now carries bargains in hatching eggs that some years ago came out in June announcements. This is to the advantage of the buyer. May is the natural brooding and hatching month; fertility is high, hatches come out like corn popping, and the chicks do well in the balmy spring weather

A Famous Work Saver

Carbola cuts in half the time and labor spent in whitewashing and disinfecting, but of even greater importance is the fact that Carbola gives much better results—which explains why it is used regularly on thousands of large and small poultry farms in every part of the country.

A hen house that has not been thoroughly cleaned and disinfected before warm weather arrives, is a dangerous place to keep poultry from which you expect a profit. It doesn't take many disease germs, lice or mites to start a plague that may wipe out a year's profits or even the whole flock. It's easy to keep your poultry house sanitary if you will use

a white paint and disinfectant combined, in powder form. It is ready to apply with a brush or spray pump just as soon as it is mixed with water. It will not clog the sprayer. It doesn't blister, flake or peel off. It is harmless to the smallest chick and is used regularly and recommended by agricultural colleges and experiment stations.

Use it Instead of Whitewash and Disinfectants

and get better results with less labor. Use the dry powder as a louse powder. Apply it directly on the birds and sprinkle it in the nests, in the dust bath and in the litter on the floor. You will never regret giving Carbola a trial.

Your hardware, paint, drug or feed dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express. Money back if not satisfied.

Review of the Standard Committee's Work.

By Theo. Hewes
(Continued from page 583.)

influence was greater than that of Committee itself. I will cite one case here: suggestions of the White Wyandotte Club when they insisted on shortening the back and body sections, and for a time injured the variety as egg producers.

Knowing the sound policy of the Revision Board which exists not alone today but which has existed for a third of a century, I naturally could not be in sympathy with the Committee of Forty in their recommendations for a utility standard that my best judgment told me would not prove successful, and the recommendations were coming from men that I did not believe had had sufficient experience to warrant their ideas being accepted as Standard but in justice to the Committee of Forty, I am free to say that they did offer some good suggestions and every suggestion that was offered by them was carefully considered at the Revision Committee meeting in Chicago. Where their suggestions were turned down there were good reasons for so doing, and in our report that will be made at Knoxville, these reasons will be explained to the Convention. We will leave it to you breeders and members to be the jury to decide by your votes whether your Revision Board acted wisely. Remember, our report is not final. It must be adopted or rejected by you, but where we are recommending Standard changes, it requires a two-thirds majority to vote down your Committee.

Every member of the American Poultry Association will have an opportunity at Knoxville to examine in detail the report of the Revision Committee. Every point submitted to Chairman Branch in the mean time will be carefully considered at the meeting of the Revision Board a few days prior to the Convention, and if considered worthy, will be submitted to the Convention as a part of our report, but one thing I want to impress upon the minds of every poultry breeder in America, and that is: the Revision Committee that met at Chicago are interested in but one thing and that is to give to the poultrymen of this country the best standard that was ever published and one that you can follow, knowing that the breed or variety that you are interested in will be improved, not alone from a fancy standpoint, but from a commercial standpoint as well.

Don't come before us in an antagonistic way, but lay your cards on the table, face up and you will find ours in the same position. We do not want to hurt any breed but we are not going to sit idly by and see a few fanciers ride hobbies to death and spoil any good breed of fowls.

It is natural for one to accept the company that he is in, but after thirty years on the Revision Board and leaving myself entirely out of it, I want to say to the Standard-bred poultry breeders of this country that there never has been a Standard Revision Committee that surpassed your committee of 1922. There are more men on this Committee who understand the little things that go to make up the perfect specimen in every breed from Bantas to Turkeys than I have ever found before on a Revision Board. There are men on this Committee with broader visions, who can see farther into the future, and have suggested improvements that mean more to the poultrymen than any suggestions that have ever been made, and I do feel that the standard of 1923, if adopted, with such slight changes as may be submitted by breeders of experience at Knoxville, will be a Standard that will last for a quarter of a century, with but very slight changes.

When our committee convened, Messrs. Lewis and Coates reported absent and Mr. Frank Platt was added to the Committee.

While Mr. Platt is one of the youngest members that I have ever served with, he is one of the best that I have ever served with. In fact, his knowledge of some of the breeds and varieties that are seldom met with was a revelation to me and in this respect, he certainly took the place of W. C. Pierce of the 1915 Revision Board.

I don't want to single out members of this Committee for comparison, but I name Mr. Platt because he was added, and it certainly would not be fair to the Canadian fanciers if I did not say that in Mr. Geo. Robertson, you gave to the Revision Committee one of the best informed men that I ever worked with. You can't lose that boy on any breed, either in shape or color, and in addition to that, he was a prince of a fellow to get along with. In work of this kind, there is a certain amount of give and take and we found Robertson absolutely

Wipe Out Every Rat and Mouse

Amazing New Discovery Quickly Kills Them All.—Not a Poison

Rats, Mice, Gophers—in fact all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. This new discovery is a fluid, true Virus. Entirely harmless to humans, poultry, stock, pets, etc.

Infests Rodents only. Greedily eaten on bait. Sets up burning fever. The pests communicate it to others, and all die outside, hunting air and water. Imperial Virus is put up in sealed bottles, thus insuring full strength and potency. Only safe, sanitary method to overcome these pests. Protect your Poultry, especially Baby Chicks and Egg Hatches.

YOU CAN GET YOURS FREE

Here's how! Send \$1.00 today (currency, M. O., Checks, etc.) and we will give you by return mail, postpaid, two regular, full sized (double strength) \$1.00 bottles of Imperial Virus. Use one to rid your place of these pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

If more convenient, send no money, just your name and address to Imperial Laboratories, Dept. 415, 2110 Grand Ave., Kansas City, Mo. Pay postman \$1.00 and few cents postage when two bottles arrive. Guaranteed to do the work to your entire satisfaction within 30 days or your \$1.00 will be cheerfully refunded.—Advertisement.

fair and always looking to the best interests of the fanciers.

Of the important recommendations that the Committee will make, perhaps there is none of more vital importance than a clear definition of feathers and the effect of size, width and texture of feathers on many of the important breeds. The color schemes were harmonized as far as possible and the Standard was so worded that a definition in one place is the same definition in any other place where the same color applies. A clear and more definite description of breast, back and body shape, the proper angle of tails as shown on living models without set rules by the compass, I am sure will meet the approval of the down-to-the-minute breeders, while the introductory pages and instructions to Judges, together with improved description of technical terms, I know will meet with the approval of every fair minded breeder in the United States and Canada.

There is in this country today, an imaginary difference, which in reality is no difference at all. For years we have had men working at cross points, because they did not take the time to find out just what the other fellow wanted. As an illustration of this, there were three factions, each wanting a color description in Anconas and each faction believing the other two factions wanted another color description. The facts are that all three of them wanted the same thing and fortunately, the majority of the Committee wanted the same thing.

The Barred Plymouth Rock breeders, through their club representatives have asked for a division of the Barred Plymouth Rocks so that they may be classed as Dark and Light Barred Rocks. This brought out what was probably the strongest fight of any one thing that has come up in recent years, but their recommendations came before the Committee too late to be considered in connection with the 1923 Revision for the constitution of the A. P. A. has set up certain limits. After patiently working with both factions, I find that there is but little difference, and the old stand patters, so-called, were willing to concede the points that were asked for, providing they did not sub-divide the variety; and in the preamble or preface, that will be recommended as the introductory page of the Plymouth Rock Standard, you will find a color description of your cockerel bred female and your pullet bred male.

This is not a part of the Standard color text, as Mr. Branch ruled that according to the Constitution, the club's report asking for two varieties could not be acted on at this meeting, but I believe if both factions in this Plymouth Rock fight will come before the convention at Knoxville and ask that this part of the constitution be waived, and further that the American Plymouth Rock Club will agree to the description in the preamble becoming the standard text, and not ask for a division of the variety, that it will be granted.

Now boys, the Revision Committee will never vote for a subdivision of Barred Rocks, calling one the Dark, the other the Light Plymouth Rock, neither do I believe any convention will ever vote it, or at least not now, and not until the Brown Leghorn boys have had at least ten years to try out their color scheme, but I do believe that every member of our Committee, if they thought it was the wish of both factions to transfer this color description which is proposed for the preamble, to the color text for the variety of our 1923 edition, would seriously consider doing so.

Please don't come to Knoxville for a fight but come to Knoxville with the best interest of the breed at heart and you are going to find that convention ready and willing, in the right way, to help you improve your breed and bring harmony and good will into your Club and send you away from Knoxville a booster for the American Poultry Association.

The Rhode Island Whites have asked for admission for both Rose and Single Comb varieties. They have a strong club backing them and have complied with all of the provisions of the constitution, but the majority of the Committee did not concur in a recommendation to admit them. The argument was, and it seemed to be well founded, that there was not sufficient difference in type of the Single Comb variety and the White Plymouth Rocks and the Rose Comb variety and the White Wyandottes and that inferior specimens of one breed might win in the other classes.

It was stated that William Halbach, the White Rock breeder, had exhibited White Rocks as Rhode Island Whites at one of our Western shows and had been awarded prizes on them as Rhode Island Whites. If this is true, then Mr. Halbach has made a very serious mistake, in my opinion, and should be reprimanded for his conduct. I must add, however, that Mr. Burton came back with a statement that when breeding Partridge Wyandottes, he had calls for his single comb sports to be shown as Partridge Rocks.

It's What You Raise That Counts

It's Not What You HATCH!

The loss of little chicks, as most poultrymen know, is enormous; ranging from 25% to 75% of almost all hatches. Most of these losses are preventable, if you feed for the first eight weeks

Conkey's The Original Buttermilk Starting Feed

The digestive organs of a little chick are extremely sensitive, and the least disorder quickly results in disease and death. Conkey's Buttermilk Starting Feed is an appetizing combination, scientifically proportioned, of pure sweet grain and concentrated sanitary Buttermilk. The lactic acid of buttermilk strengthens and tones up the sensitive digestive organs of the little chicks and helps prevent White Diarrhea.

Conkey's is different. We use Semi-Solid Buttermilk only. It's the original Conkey process that makes chicks thrive so wonderfully on it. After 8 weeks, feed Conkey's Buttermilk Growing Mash. Any feed that is sold for both starting chicks and growing them beyond the first 8 weeks is unscientific and unsafe.

Be sure to get Conkey's Remedies and Feeds in the original packages. Sold by dealers everywhere. Big Poultry Book sent free. [64]

Kills Hatching

Many fanciers now use Egg-O-Latum, the
great egg preserver, on all eggs for the mar-
ket. It not only keeps them fresh but pre-
vents hatching, thus protecting against the
pirates who watch to obtain high grade hatch-
ing stock at market prices. Rub on—wipe off—
does not show—Eggs will never hatch but
keep fresh longer.

Egg-O-Latum is a soft, white, cerate wax
colorless, tasteless, harmless. Applied by simply
coating palms of the hands, then rubbing on eggs,
a dozen a minute. Keeps eggs fresh one year. A
50c jar enough for 50 dozen eggs. \$1 jar for 200
dozen. If no dealer, order by card. Postman will
collect. No. extra charge. Handy ad. phoning.

LEGGETT'S SUPERFINE
Highest Quality

COLUMBIAN WYANDOTTE

Eggs \$5.00; \$10.00 Per 15

H. A. D. LEGGETT, WINOOSKI, VERMONT

There is perhaps no one breed that is not recognized by the Standard that has a follow-
ing anyways near as strong as the Rhode
Island Whites. Their year book, just issued,
surpasses that of any specialty club that we
have received to date. There is an immense
amount of money invested in them, and per-
sonally, I would have liked to have seen
them admitted; but the majority of our Com-
mittee, after all facts were submitted, and
every member had a right to a full and com-
plete discussion, voted them down, and our
report will be unanimous as against their
adoption, as I for one believe in a demo-
cratic form of Government and that a ma-
jority should rule. However, if the Rhode
Island White breeders come before the con-
vention with sufficient strength, a two-thirds
majority vote would admit them to the
Standard.

Your Committee will recommend separate
breed standards for six of the important
breeds and if it is feasible to do so, will
recommend a reduction in the retail price
of the general Standard to \$2.00, and a breed
standard that will retail at 50c.

Come on to Knoxville and help us do this
big job and do it right, to the lasting credit
of the purebred poultry industry of America.
In so doing you will have helped pull the old
Association out into deep water where the
sailing will be easy.

Standard Orpington Type

By E. F. Doty

The Revision Committee appears to be
working in the right direction and I am glad
to note they have turned down the Club's
recommendations to include the "forward tilt,"
which is a purely fancy point, and with
proper construction of body, breast and back
and properly set on the legs this recognition
of "forward tilt" is not necessary in order to
describe Orpington type.

It is very encouraging to note the active
interest taken in the proposed Standard de-
scription by the Orpington experts who met
during the recent New York show to discuss
this project and it is greatly to be hoped that
in the final analysis a suitable description will
be developed as to what is really wanted in
the perfect Orpington which can be clearly
understood by the novice.

Undoubtedly our Orpington experts know
exactly what is required in the perfect bird
and are pretty well agreed on the important
features; for that reason I hesitate, as an
amateur breeder, to break into print, and it
is solely under the plea that greater care
than usual should be taken in preparing de-
scriptions which will be absolutely beyond
question as to what is wanted.

I rather regret that the New York assembly
have apparently endorsed the Committee
of Forty's description of back shape, and
that they intend to describe a back which
in top view tapers from its greatest width
across the shoulders to a width of "nearly as
great as between wings at shoulders," across
the saddle. This is absolutely a description
of a wedge shaped body in a plan view, which
tapers from its greatest width across the
shoulders, towards the tail. I do not believe
that this is what we are really aiming at, and
even if a bullseye is rather uncommon, that is
no reason why we should not shoot at it and
endeavor to breed birds with as great width
across the saddle as across the shoulders.
Notwithstanding how the new Standard may
read I intend to breed such backs if it can
be done; and if it can be done I expect to
win with them over the birds with wedge-
shaped backs, under our best judges, other
things being equal.

Another point in back construction which
merits attention is in connection with breadth
of base of tail and spread of tail. This has
to do with the shape of a bird's carcass at
the end of back, which must be wide and
square in order to provide a base for the
wide, well spread tail to spring from.

Thus it will be seen that shape of back is
highly important from the utilitarian stand-
point as well as for the presentation of breed
type, for the wide, square backed carcass
means more meat and greater egg capacity.

Glad to see your remarks on page 347 of
March issue of A. P. J. regarding flat backed
and flat tailed birds not being wanted and it
is to be hoped that if the angle of tail car-
riage is lowered as it should be, that it will
not be with the result that these horizontal
top lines will be favored as against a bird
with the proper concave sweep which might
result in a tail carried slightly above, the
orthodox angle.

There is still another feature which has an
important bearing on back shape and breed
character and that is wing carriage.

The New York conference is reported as
having favored a description which includes
"carried on the level of body." Now, what
does this mean and what part of the wing
is to be carried on the level of body and on
a level with what part of the body? I do

Baby Chicks

Sturdier chicks
than we distribute
are not produced. Stand-
ardbred chicks, pro-
duced according to natural laws,
are chicks which will give results.
We specialize in the following vari-
eties and guarantee safe delivery at
the quoted prices per 100:

S. C. White Leghorn.....	\$11.00
S. C. Brown Leghorn	11.00
Barred Plymouth Rock.....	12.00
S. C. Rhode Island Red.....	12.00
R. C. Rhode Island Red.....	12.00
White Wyandotte	13.00
Silver Laced Wyandotte.....	13.00

These prices effective on deliveries of May
15 and through June, and apply on all or-
ders for 25 or more chicks. 5 per cent dis-
count on orders for 500 or more chicks.

J. R. HUDSON, Printer, Hardin Springs, Ky.

not pretend to understand this description at all.

If it is intended to mean the upper line of the wing, it certainly is not carried on a level with any part of the body; and if it is the lower line of the wing then what part of the body should it be level with?

I am inclined to think that the lower line of wing is what the conference referred to and if this is the case it should say so and make it plain as to what part of the body it should be level with.

Perhaps they mean that the underline of wing should be level or parallel with the underline of the body or what would possibly be a better description would be "parallel with the ground or surface on which the bird stands," as the underline of many birds is, on account of the profusion of plumage, not exactly discernable as they stand in the coop.

At any rate the description should be made clearer and it should also be brought out that the wing points should be carried well up as this style of wing carriage assists considerably in adding to width across saddle; as the wing points tend to spread out the saddle feathers where they hang over the wing points.

Still another point on which there should be no mild mannered description is the neck.

The neck should be short and stout or thick with very profuse covering of plumage which is responsible for the well arched neck like a well bred draft horse.

"Moderate length" or "rather short" is too indefinite; we, of course, do not want them with the head growing right out between the shoulders and no length of neck whatever, but don't believe there is any likelihood of breeding them this way.

In humans as in Orpingtons and all animal life a short thick neck is the natural accompaniment of wide, thick shoulders, large breast development and a robust constitution.

The short, well arched neck harmonizes with other important Orpington characteristics and I think breeders and experts will agree that there is no danger of breeding them with necks that are too short, while a long, straight neck upsets the proportionate balance of an otherwise good bird.

Mr. Moore's proportionate dimensions as explained on page 347 of March A. P. J. are interesting and look to be about right, except, as I have expressed the opinion above, would like to see the cocks ten inches across the saddle.

However, dimensions of this kind can only be approximate and cannot be used in judging as they apply only to a bird as it stands still in the coop, or in other words, as it poses in as nearly a perfect attitude as it is capable of. As soon as a bird moves all of the dimensions change more or less.

I would also like to see ideal illustrations of birds in addition to the profile or side illustrations in the present standard. A front view, rear view and top or plan view of a perfect bird would be very enlightening to us amateurs and perhaps to some of the experts.

I would suggest that in order to provide such drawings without materially increasing the cost for same that outlines only are necessary to show the shape properly, with just sufficient fillings in the drawing to indicate wing lines and such details. The time necessary to develop such shading of the drawing as is used to illustrate the present standard could thus be applied to making the extra views.

It is also to be hoped that the new illustrations will be entrusted to an artist who is thoroughly familiar with Orpington type and can bring out just the right lines that denote character, otherwise the illustrations will represent little more than a picture of a large bodied meat chicken.

Net For Catching Chickens

I have never seen anything in print with reference as to an easy and practical way of catching chickens, and thought perhaps the following suggestion would be of interest to those who have experienced trouble in catching them as I did before I conceived the idea: Use an ordinary minnow dip net with handle long as desired, and you can catch them with as much ease as catching minnows and it will not frighten or injure them. I raise Leghorns and all know who have had experience with them, that they are hard to catch unless you have them quartered in a close place; and no matter how close they are quartered, I find the above method a labor-saving device. Try it.

G. M. Martin.

Keep Down the Louse Pest

It means better fowls, more eggs, better growth in chicks. Chicks are coming along now. Don't let them be pestered to death. Sprinkle Dr. Hess Instant Louse Killer in the feathers, in the nests, on roosts, about pens, coops and yards. Be sure to keep it in the dust bath all the year 'round. That means louse prevention. When setting the hen sprinkle it in the bottom of the nest before adding the litter and the eggs. Then your brood will come off free from lice.

An excellent bug killer to use on cucumber, squash, and melon vines, slugs on roses, etc. Guaranteed.

How to Build Poultry Houses

A new book just out, devoted exclusively to the building of poultry houses of all kinds and descriptions. Besides telling how to build the houses properly, it tells how to make feed troughs, nest boxes and water troughs. It gives complete plans, as well as the approximate cost of construction. It also contains plans of roosts and dropping boards; the brood coop; the brooder house; the fattening coop; the winter brooder house; the fattening coop. 75c postpaid. American Poultry Journal, 523 Plymouth Ct., Chicago, Ill.

LEE'S LICE KILLER

Kills lice, mites, head bugs, etc., affecting poultry. Spray or pour on roosts, etc. Gets body lice on chickens, too. Works while they sleep. No fasting, dipping, greasing or handling. Saves lot of unpleasant work. At most towns, stores handling Live Poultry Supplies. Write for information and FREE Book. **GEO. H. LEE CO., Dept. P-2 OMAHA, NEBR.**

I have been a very interested reader of your Horticulture for Poultry Keepers in the American Poultry Journal for some considerable time, being a regular subscriber; and I want to know if you will give me your advice as to the best sort of winter apples for British Columbia. I intend to plant out three acres and would like to have the Golden Delicious and Red Delicious if you think they would do here. I have a light gravelly soil on a southern slope, overlooking the Fraser river. Would also like your advice on the best kind of plum trees. Would like to use Stark trees. I intend to raise young chicks in the three acres, so I might as well use fruit trees for shade as anything else. Also would like to know the address of the firm that publish the "American Fruit Grower." I have heard of a monthly publication of that name.

British Columbia, Canada.

The Red Delicious is an extremely hearty apple tree and is fruiting far to the north where the thermometer drops to fifty degrees below. I have picked apples from the Delicious trees three hundred miles east of Quebec, Canada. It remains to be seen whether or not the Golden Delicious is hearty enough for extremely severe climates. I advise you to make your planting largely of Red Delicious, King David, Senator, and the balance of the orchard I would by all means plant a few Golden Delicious as I believe that it is the best and most profitable of all yellow apples.

You will find the Omaha, Terry and Surprise plums very profitable. They are extremely hearty. You should have a number of Professor Hanser's Hybrid plums. You can secure these of the Gurnsey Fruit and Seed Co., Yankton, South Dakota.

* * *

1. Can scions and buds of native American plums, such as Wild Goose and Forest Garden, be grafted and budded onto wild American plum seedlings and sucker sprouts?
2. Are common cherry seeds, such as Montmorency and Richmond, suitable to plant for seedling stocks, to be grafted?
3. Can concord grape cuttings be grafted onto wild grapevines?

Illinois. Norman S. Kare.

Answering your questions in the order as asked:

1. Yes.
2. Yes.
3. No.

* * *

Will you be good enough to advise me if 6 to 12 year apple trees can be moved or transplanted? I live on the east shore of Lake Washington, 17 miles from Seattle. Some of my friends have suggested that transplanting old trees would be successful if one pruned the trees vigorously and be careful to place in the same relative position, i. e., that part of the tree facing north should be to the north after it is set.

Washington. C. S. Jackson.

Apple trees six or twelve years old can of course be removed but as a general proposition this should not be attempted. If removed in the winter a large ball of earth should be attached to each. Transplanting can be successfully accomplished.

* * *

About a month ago I bought five acres at Muskegon, Mich., for \$1,650. Or rather I am buying it on monthly payments. There is a four-room house and a barn, also a well on the place. I intended to raise chickens and truck. At the time I looked at the place, there was about three inches of snow on the ground and I, being a "city farmer," did not think to look at the earth under the snow.

Now I have learned from a Michigan farmer that the place is nothing but sand and he

says that I cannot raise anything on that place. He says that I may get it up out of the ground, but before it is any good it will dry up for the want of water.

What do you think about it? The land is level and was worked once by someone. There is about one-half acre of young oak trees and shrubbery also.

What can be raised on sandy land in that locality? There are other little five-acre farms around there—they must be making a living somehow.

Let me also say the wife and I are both 30 years old with no children. We are full of "pep" and not easily discouraged, but we can't live on sand if that is all there is to be had there.

Illinois.

W. L. Cooper.

Your experience is a very common one. There is an organized band of real estate sharks in Michigan who have successfully prayed upon city men and women who have formed the idea that about all the joys in life can be found upon small fruit farms not far from Chicago. I am of the opinion, however, that the land that you have purchased as you describe can have small fruit and vegetables grown thereon. It is possible that a living and a competence can be made on five acres of land as a successful fruit farm, but as a general proposition this cannot be done. I advise you to make a thorough investigation of the fruit farms in your immediate vicinity. By so doing you will be able to ascertain whether or not it will be wise for you to attempt to operate this land for this purpose.

* * *

What is your opinion of a small orchard located here to supply local markets with apples, plums, cherries, strawberries, raspberries and blackberries? Can these be raised successfully and profitably here?

Kindly name some varieties of each that you would recommend. What is your opinion of the everbearing strawberry as a commercial variety?

Iowa.

Orwald Joseph.

A fruit farm located as you suggest should be profitable if properly managed. I advise you to plant the following fruit:

Apples: Henry Clay, Dutchess, Wealthy, Patuns, Greening and Delicious.

Such a planting will give you fruit from very early until very late.

Plums—Omaha, Terry, Surprise.

Cherries—Early Richmond, Montmorency.

Strawberries: Senator, Haveland, Gibson, Sample.

Raspberries: Royal Purple, Cumberland.

Blackberries: Snyder.

Would advise you to refrain from planting the everbearing strawberries as a commercial proposition.

* * *

I am contemplating starting a fruit and poultry farm about 20 miles from Cleveland, and would thank you very much for your advice as to setting out as well as varieties. My location is quite rolling, sloping to the east and north. Clay loam, heavy clay subsoil. I have planned to set out about six acres of apple orchard and about six acres of peach, cherry, plum and pear trees, also grapes. I had thought to set out my apple orchard, for the main, long lived trees, such as Baldwin, Greening, Northern Spy, Belmont, etc., planting them in squares 40 feet apart. Then plant in quick bearing apple trees every 20 feet, intending of course to cut out the quick bearing as soon as they begin to crowd. Would it be better to plant them all about 30 feet square? Is there any advantage in dynamiting where the subsoil is heavy before planting? If so how much and how deep.

I want to set out about 2,000 grape. What varieties are best, also what varieties of other fruits would you advise? What are some of the best works on horticulture.

Ohio. A. A. Bolles.

The theory of planting an apple orchard with fillers is a good one. However, in practice it does not work to advantage in many cases. I strongly advise you to plant your apple orchard with trees 30 feet apart each way. For the first few years you can clear revenue from this ground by planting sweet corn, potatoes, or anything which will require constant and thorough cultivation up to about July 15. By so doing you will bring the orchard to bearing in perfect condition, the trees being hearty and well grown.

I would not plant the varieties you name. Instead I would have the orchard composed of Delicious, Golden Delicious, King David, and Senator. These are apples of exceptional quality, heavy producers and demand the highest market prices in the market.

For commercial vineyard I would advise you to plant Concord and Warden, making the vineyard two-thirds Concord and one-third Warden. Your land as described is especially well adapted to the raising of fruit.

"The Apple Orchard," "Small Fruit Growing" and "Commercial Fruit Culture" are books which you should read carefully. You can secure these through your local book dealer.

Leg Weakness

By Geo. W. Miller

Baby chicks can be reared as successfully in February or March as in April or May, and that without being allowed on the ground or being given any green feed!

To most poultrymen this statement sounds like romancing of the wildest description. Indeed, one of the great handicaps to winter egg production, they will tell you, is the high mortality in early hatched chicks. True, the advent of the stove brooders lessened this mortality somewhat. There still remained a percentage of loss, however, not only from mortality, but from weakness engendered in brooding that made serious inroads on the profits.

Prof. W. R. Graham, of the Ontario Agricultural College, has made a discovery this year, the tests in connection with which gives the fullest proof to the statement in the first paragraph, and is another evidence of the excellent work that is being done by the poultry department of this famous institution.

Two years ago the College authorities at Ames, Iowa, were carrying on some experiments to discover how long calves would live and how fast they would grow if fed on cows' milk alone. The calves came along splendidly until they were about six months old when rickets, a mal-nutrition ailment that showed itself in a softening of the bones, would develop, and each affected calf would die in two or three days after the disease made its presence apparent. After several calves in the test had died, another one developed the trouble, and its death was expected. Accidentally or otherwise, a can of tomatoes was spilled into the feed of milk, and milk and tomatoes were given to the calf. The herdsmen were surprised next day to find it had recovered entirely, and was apparently as well and strong as ever. Tomatoes were mixed with the milk in feeding the

calves from then on, and no more of the calves died.

Now, rickets in calves and leg and wing weakness in chicks are kindred troubles, and Prof. Graham reasoned that what would prevent the one would likely prevent the other. With the first lot of incubator chicks that were hatched at the College in January he made the experiment of introducing canned tomatoes into the dietary.

The first feed was made of equal parts of cornmeal and wheat shorts, moistened sufficiently with tomatoes—the kind you buy in tins at the grocers—to make it crumbly. The second feed was also cornmeal and wheat shorts, but moistened with equal parts of buttermilk and eggs ("egg nog," Prof. Graham calls it). These two mashers were alternated for the first six or eight weeks, nothing else except buttermilk to drink being given. No scratch grains whatever were fed. The mashers were given on pieces of boards, some rolling into the alfalfa litter which covered the floors. This the chicks later found amusement and exercise in scratching for.

As usual in all such tests at the O. A. C. careful records of the weights attained at successive periods by the chicks were kept, and it was found that the growth of this lot was steadily thirteen percent above the normal curve.

This increase in growth rate, of course, was most satisfactory, but there still remained the more important result that mortality was practically wiped out and no cases of leg weakness or drooping wings developed.

Prof. Graham, with his usual modesty, is not making any great claims as the result of these tests, but his staff are satisfied that he has made in this one of the greatest discoveries for the advancement of economic poultry keeping ever made at the O. A. C. One thing is certain, never before on March 25 has the brooding at the College come through with such low mortality or has such high general vitality in the chicks been so apparent.

Early Crowing Leghorns

The accompanying illustration is of a S. C. White Leghorn cockerel that

Age six weeks. Weight one lb.

nesses will bear out these facts and records. Mr. Quisenberry in his works shows a cockerel crowing when 7 weeks, 2 days old; weight 1 lb., 2 oz. If that is phenomenal, then is this not an unusual record?

The Blue Hen that Turned White.

A most singular instance of a normal Blue Andalusian hen whose feathers changed to white has been reported by Professor William A. Lippincott of the Kansas Agricultural Experiment Station. By citing her breeding performance he declares that the change might serve as an example of the independence of the body-plasm and the germ-plasm.

Blue Andalusian hen at end of season's molt when first showing change to white plumage

What seemed to be a normal Blue Andalusian hen was obtained from the University of Wisconsin. This hen was from a pedigreed family whose members had not shown any unusual traits. Soon after she reached Kansas it was noticed that some white feathers were coming in on her neck and a little later that her developing primaries were white. In other parts of her body new feathers were coming in that were normal blue. By this time she had completed her molt.

During the next July when she molted, all of her old feathers, whether blue or white, were replaced by only white. When she finished her molt she was entirely white throughout.

Before she had shown any tendency to change color, she was mated to a Blue Andalusian male. Of the five chicks hatched, one was blue-splashed and four were blue. Later, while her neck and wing tips were white, she was mated with a White Wyandotte. Of the 28 chicks, 13 were blue and 15 black. The next season when she was

FIRST PULLET NEW YORK 1922

Statement of the Ownership, Management, Circulation, etc., Required by the Act of Congress of August 24, 1922

OF AMERICAN POULTRY JOURNAL, published monthly at Chicago, Ill., for April, 1922.

State of Illinois, County of Cook, ss:

Before me, a Notary Public, in and for the State and county aforesaid, personally appeared James W. Bell, who, having been duly sworn according to law, deposes and says that he is the Editor of the American Poultry Journal, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to-wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher—James W. Bell & Co., 523 Plymouth Court, Chicago, Ill.

Editor—James W. Bell, 523 Plymouth Court, Chicago, Ill.

Managing Editor—James W. Bell, 523 Plymouth Court, Chicago, Ill.

Business Manager—James W. Bell, 523 Plymouth Court, Chicago, Ill.

2. That the owners are: (Give names and addresses of individual owners, or if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.)

James W. Bell, 523 Plymouth Court, Chicago, Ill.

H. M. Bell, Congress Park, Ill.

Henry G. Eisert, 523 Plymouth Court, Chicago, Ill.

B. M. Eisert, 4040 Broadway, Chicago, Ill.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.)—None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and security in a capacity other than that of a bona fide owner, and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown herein is: (This information is required from daily publications only.)

JAMES W. BELL, Editor.

Sworn to and subscribed before me this thirtieth day of March, 1922.

(SEAL) ALICE A. SHEHAN, Notary Public. (My commission expires June 20, 1924.)

A Straight Draught Without Any Turns

Cantleak Chimney Flange

Patented August 17th, 1920

can be set up on any roof and it will give you straight draught, from your fire up thru your chimney, and a straight draught without any turns is what you want to keep a fire going properly.

Lord Farms, the inventors and manufacturers of the Cantleak Chimney Flange, have been experimenting for a number of years and at last have found the way to obtain a straight and steady draught for the coal burning brooders and mammoth incubators, or wherever a fire is used in an out building.

No wire stays to support chimney—easy to slip it into place and it will stay there. Takes less than two minutes to set up and take down. Write today for one and forget your chimney troubles.

GEM PRODUCTS CO., Box 22, Greenville, O.

solid white she was mated to White Plymouth Rock. Of the 25 chicks, 7 were blue and 18 were black. During the next season, she was mated with a White Wyandotte. Of the nine chicks, three were black, four were blue and two were white. It is clear from these results that although the hen was solid white she continued to breed as a Blue Andalusian.

III.

Geo. F. Paul.

Care of the Growing Stock

The average person thinks that after the chicks have been hatched and brooded, up to the time that they can do without the mother hen or the brooder stove (which ever the case may be) that they can then care for themselves, and need little or no attention. This is where a big mistake is made. Unless you give your growing stock special care in feeding, housing and general management, you cannot expect to raise a flock of birds that will win at the shows, or that will shell out the eggs in a profitable number and at the season of the year when prices for eggs are highest. We are too quick to blame the incubator or brooder we use, or the poultryman whom we bought the eggs or chicks if our birds do not come up to the standard we thought they should, when we ourselves are to blame for not giving our growing birds the proper range, feed and care when they most need it.

The main idea in growing young stock is to feed and care for them in such a manner that they will be kept steadily growing (never having a setback) and in this way will mature into healthy, well developed birds.

When feeding growing stock remember the feed which you are giving your birds now contains the material that is to build up a strong body, strong organs and a strong constitution, and unless you think of this now and feed and care for your young stock accordingly, it will be useless to wish you had done so later on when you discover that your birds have not the constitution to stand up under heavy egg production and therefore will not make themselves a paying proposition. Growing stock should have a grain feed, dry mash, sour milk or butter milk, green feed and water. Feed the grain and dry mash in hoppers so that your birds can get all they want and know that it is there for them whenever they want it. Have you ever noticed a flock of growing stock that was hand fed? When you go out in the morning to feed them they are waiting to fill up on the grain and then seem satisfied and will not get out and scratch and dig for their feed as they would if they were hopper fed. Where you feed your birds by this method they will get out and dig for worms and bugs and after they have a fill of these they will return and go to the hoppers for the grain and mash.

Sour milk or buttermilk is one of the best things you can feed growing stock; you can use it to mix up a wet mash with, and feed about noon besides keeping it before them at all times. It is best when feeding milk to always feed it sour and not feed sour milk at one time and sweet another. When feeding buttermilk always feed it in either

earthenware or wooden ware. Do not feed it in metal dishes.

Green feed is very essential and is one of the best tonics you can give your growing stock, the birds should be given range with all the green feed they want; when they are confined such greens as sprouted oats, alfalfa, clover or cabbage should be fed in generous quantities daily.

Water is one thing that is often neglected. Your birds should have clean fresh water before them at all times, and in the hot days of summer care should be taken to see that it is kept in a shady place.

Your growing stock should be properly housed. These should be built the colony style, so that they can be easily moved from place to place as you need them, and also for to furnish the birds with new range and shade where the ground has been sown to some kind of grain or planted to corn. No definite style of house is recommended as long as it is dry, well ventilated and built so it forms a good protection for the birds during the stormy weather. A

First prize S. C. Ancona cockerel at Baltimore, 1921. Owned by G. G. McLaurin, Box 93, Dillon, S. C.

very common mistake and one that cost many a poultryman a great deal, is in crowding the young stock in the colony houses. Remember your birds are growing rapidly and care should be taken to give them plenty of room, keep the flock well culled out, and remove the cockerels, and whatever you do, do not crowd too many birds in one house.

Growing stock should have free range, they will make more rapid vigorous growth, and the cost of feeding birds that are kept on range is considerable less as they find other feed on the range such as bugs, worms and wild seeds.

Shade is very essential, if you have no shade for the stock, plant corn and let them run in this or put up a temporary shade, as the birds should not have to stay in the heat of the sun all day.

Keep the houses and yards clean and sanitary. Unclean buildings and yards breed disease, and make a breeding place for lice and mites, and birds that are infested with vermin and have to spend their time scratching and digging after these parasites lose lots of time that they should be out looking for bugs and feed, and lose their rest at nights. As soon as the birds are large enough to tell the cockerels from the pullets, the young males should be culled and

those not intended for breeders should be fattened and placed on the market. About a month before time for the pullets to start laying, move them to their permanent laying quarters. Do this early. If you wait until they start laying you are apt to throw them into a fall molt from which they generally do not recover until spring, thus being an expense for you to feed during the winter months when eggs are high and when you need a full egg basket the most. As these pullets start laying, if you will trap nest or keep track of the early layers and mark them so that you can tell them when they are matured you can use them in your breeding pen and in this manner you will be raising stock from your best layers each season.—J. C. Taylor, Calif.

First prize Buff Orpington pullet at Chicago National Show, 1922. Owned by Bonnie Brae Orpington Farm, Sandusky, Ohio.

The View of a Poultry Judge.

By W. E. Stanfield

At the recent session of the Standard Revision committee a petition was drawn up and signed requesting the coming Knoxville convention to authorize President Rigg to appoint a committee to revise the present constitution of the American Poultry Association. This looks like a move in the right direction. That there are a few things about the present constitution of the A. P. A. that should be changed none of us question. No doubt a thorough job of revision should be done, and in order that this may be accomplished let us hope that the coming convention to be held at Knoxville will look at this matter of revising the A. P. A. constitution with a serious attitude of mind; and let us hope that a good piece of work will be accomplished. The committee appointed to do this work should be an able committee, a committee that will have full conception of the great possibilities of the American poultry industry, and the part that the American Poultry Association and Standardbred Poultry should take in building and extending this great American industry.

We want greatly increased membership in the A. P. A. for one thing. We need to have plans inaugurated that will get this membership. In the United States and Canada there are masses of people that would be boosters of Standardbred poultry and all that this class of poultry stands for, were they but given an opportunity.

I have never been very keenly interested in the affairs of the American Poultry Association, especially in a political way. I frankly admit this to be sort of a confession that one in my position should be ashamed to make. However, it is more or less true, with exception perhaps of the past year. During this time I have watched with interest the various movements that have been carried on in connection with the American Poultry Association affairs. Particularly has this been so with reference to what has transpired with the national organizer's position, Mr. Ed. L. Hayes. I feel that his efforts will result in enlightening the membership to the possible failures and probable opportunities in connection with the old Association, and this may mean more for the future welfare than we fully realize at the present time. Personally, I feel it of vital importance that we, as younger men, holding the interests of the American Poultry Association at heart, exert proper effort and in the right way, in an attempt to save the old Association. Now I think that there is still hope, but the hope rests on radical changes which will have to take place without much further delay.

There is one thing that I want to take time to remark on in this letter to you and that is on the question of utility poultry. If the time ever comes that the American Poultry Association, through its Standard of Perfection, recognizes this utility proposition it will have a strong tendency to undo to a considerable degree what has been accomplished in years past—namely, to gain a better attitude toward Standardbred poultry, which means better poultry on the farms. Today the farmer is looking with favor on Standardbred poultry—more so than ever before. The farmer who has been given proper information, and I might add inspiration, knows that Standardbred poultry is good looking poultry, uniform in quality and productive.

Now what is going to happen if the Standard recognizes so-called production classes of poultry? I can tell you what I think will happen. The bars will be down and the farms will be flooded with a type of poultry that will be anything but representative of what is supposed to constitute good poultry of the various breeds. The hucksters have done enough of this already. What will they and others do if they can use this utility camouflage to help spread their wares? I think if the tendency is strong enough towards utility and utility poultry and egg records irrespective of established Standard quality, this class of breeders should get together and perfect their own organization.

I feel considerably peeved at what is being said about utility White Leghorns. Those glaring page ads of 370 egg hens with their high tails and big combs are creating altogether too much interest right here in the State of Minnesota on the part of prospective White Leghorn breeders, even though we have in the State of Minnesota quite a large number of extensive and very successful White Leghorn farms, of which most of them are breeding a Standard type of Leghorn and seem to be satisfied with their actual egg records.

Four years ago when I first came to this State for the U. S. Department of Agriculture, I well remember my first trip to Barnum, the famous White Leghorn District. I was rather discouraged at the general average quality of stock found there. They were of the beefy type, big in comb, with horizontal bodies and high tails. I plead guilty to having started in at once to urge a better type of Leghorn for them. Two weeks ago I spent the large share of a week in this Barnum District, at which time I was called upon to certify 38 farm flocks running from 150 to 1,000 in a flock, yearling hens, from which eggs for hatching and baby chicks were going to be sold through the new organiza-

Rid Hens & Chicks of Lice and Mites

A Few Drops of Wonderful New Remedy in Drinking Water Does It—No Dusting, Spraying or Greasing.
